Good end of life care is essential in dementia, but is not always delivered. The author explains her role as an advanced nurse practitioner at Rawthorpe Care Village in Norwich. She has developed her own approach to “comfort care” (care oriented to the end of life), as something sensitive to the needs of residents with advanced dementia. Communicating an understanding of comfort care to carers and family members can also give then a chance of a bereavement that is peaceful. (RH)

As more people die with dementia, end of life care discussions are growing in importance. The author and colleagues report on their study and explain how co-designing new resources could help to strengthen support at the end of life. They use findings from the Supporting Excellence in End of Life care in Dementia programme (SEED study), which has developed a nurse-led intervention which has been tested in primary care settings. The authors have used this model to dementia nurse specialists work more effectively with patients and their families and improve the knowledge and skills of patients’ health care teams. They outline how they developed a new resource by mapping existing resources, which led them to use a co-design approach to develop a prototype Care Plan Guide (CPG). This was tested in co-design workshops with some of the support workers and nurses who would be using the resource. (RH)

BGS Newsletter, no 64, February 2018, pp 6-8.
Storytelling has many roles within society, including in geriatric medicine. It unites us, imparting wisdom from one generation to the next, and gives us a glimpse into the lives of those dearest to us. It can also be used to reduce anxiety when faced with difficult subjects such as end of life decisions and Advance Care Plans. (RH)

Moving from place to place in the last year of life: a qualitative study identifying care setting transition issues and solutions in Ontario; by Donna M Wilson, Stephen Birch.: Wiley, March 2018, pp 232-239.
As death nears, moving from one care setting to another is common. Many concerns exist over these end-of-life (EOL) care setting transitions, including low-quality moves as mistakes and other mishaps can occur. Delayed or denied moves are also problematic, such as a move out of hospital for dying inpatients who want to spend their last hours or days at home. This Canadian study aimed to identify current issues or problems with care setting transitions during the last year of life as well as potential or actual solutions for these problems. A grounded theory analysis approach was used based on interviews with 38 key informants representing a wide range of healthcare providers, healthcare managers, government representatives, lawyers, healthcare recipients and their family or friends across Ontario in 2016. Three interrelated themes were revealed: communication complexities; care planning and coordination gaps; and health system reform needs. Six solutions were highlighted, which were designed to prevent care setting transition issues and to monitor care setting transitions for continued improvements. (RH)

This is the second in an occasional series of paired commentaries in Age and Ageing, the Journal of the British Geriatrics Society and the Journal of the American Geriatrics Society (JAGS). The aim is to address issues of current significance, and to foster dialogue and increased understanding between academics and clinicians
working in comparative international settings. Both commentaries address the urgent need to improve palliative care for older people, with a critique of some stereotypes surrounding palliative care and the 'good death'. The companion commentary, published in JAGS, was written by Alexander Smith and Vyjeyanthi Periyakoil, and is grounded in their experience as academic clinicians (Smith A K, Periyakoil V, Should we bury 'The Good Death'? Journal of the American Geriatrics Society 2018; in press). In the present paper, the authors offer a perspective on the outcome and wider consequences of misalignment between current UK policy and aspirations for end of life care in relation to epidemiological trends and patient experience of death and dying. Rural residents' perspectives on the rural 'good death': a scoping review; by Susanne Rainsford, Roderick D MacLeod, Nicholas J Glasgow (et al): Wiley, May 2018, pp 273-294.

The 'good death' is one objective of palliative care, with many 'good death' viewpoints and research findings reflecting the urban voice. Rural areas are distinct and need special consideration. This scoping review identified and charted current research knowledge on the 'good' rural death through the perspectives of rural residents, including rural patients with a life-limiting illness, to identify evidence and gaps in the literature for future studies. A comprehensive literature search of English language articles (no date filter applied) was conducted in 2016 (2 January to 14 February) using five library databases (PubMed, CINAHL, Scopus, PsycINFO and Web of Science). Reference lists of included articles, recent issues of eight relevant journals and three grey literature databases were also hand-searched. Twenty articles (for 17 studies and one systematic review) were identified after a two-phase screening process by two reviewers, using pre-determined inclusion criteria. Data from each study were extracted and charted; a thematic analysis was used of the included articles' content, and with a quantitative analysis of the scoping review. These papers revealed data collected from rural patients with a life-limiting illness and family caregivers, rural healthcare providers, the wider rural community, rural community leaders and rural health administrators and policy makers. Rural locations were heterogeneous. Residents from developed and developing countries believe a 'good death' is one that is peaceful, free of pain and without suffering; however, this is subjective and priorities are based on personal, cultural, social and religious perspectives. Currently, there is insufficient data to generalise rural residents' perspectives and what it means for them to die well. Given the extreme importance of a 'good death', there is a need for further studies to elicit rural patient and family caregiver perspectives. (RH)

There is increasing diversity among Canada's older population today. The purpose of this study was to help fill research gaps on ageing and end-of-life among Canada's LGBT (Lesbian, gay, bisexual and transgender) older population. Through focus groups the authors sought to better understand the lived experience of older LGBT individuals and to examine their concerns associated with end-of-life. The study analysis highlighted the idea that identifying as LGBT matters when it comes to ageing and end-of-life care. In particular, gender identity and sexual orientation matter when it comes to social connections, in the expectations individuals have for their own care, and in the unique fear related to staying out of the closet and maintaining identity throughout the process. This study underscores the need to consider gender identity and sexual orientation at end-of-life. In particular, recognition of intersectionality and social locations is crucial to facilitating positive ageing experiences and end-of-life care. (JL)

Advance decisions: issues of autonomy, identity and efficacy; by Sue Wilkinson.: Emerald, 2017, pp 4-12.
Working with Older People, vol 21, no 1, 2017, pp 4-12.
The Mental Capacity Act 2005 came into force in 2007, since when there has been statutory provision for making a legally binding advance decision. This paper introduces Advance Decisions, to indicate reasons for their low uptake, and examine fundamental issues that can inform the development of policy and practice in this area. The paper discusses findings from a research project with the charity Compassion in Dying (analysing calls to its telephone helpline) and practical experience of working with the charity Advance Decisions Assistance (helping people write Advance Decisions and training healthcare professionals). Older people themselves identify the
issues of autonomy, identity and efficacy as key challenges in writing Advance Decisions and having them respected. (RH)

Advancing care: research with care homes; by Kristina Staley, Tara Lamont, Tannaze Tinati, Tansy Evans, National Institute for Health Research - NIHR; NIHR Dissemination Centre.: National Institute for Health Research, July 2017, 44 pp (Themed review).
More than 400,000 older people live in 19,000 independently owned care homes in the UK. The National Institute for Health Research (NIHR) has funded this themed research review, which focuses on studies wholly or partly funded by the NIHR on three main themes relating to the care of care home residents. First, Living well, on maintaining good health and quality of life, also considers routine health checks, preventing avoidable health problems, improving nutrition, and finding better ways to reduce depression and pain and manage incontinence. Second, Ageing Well, concerns managing long-term conditions associated with ageing, particularly finding ways to improve the care of those living with dementia; identifying the needs of ageing residents with multiple serious conditions; and strategies to reduce medication errors, and avoid hospital admissions. Lastly, Dying Well, on ensuring a good quality end of life, looks at preferred place of death, supporting the very old at the end of life, and end of life care of people with dementia. Summaries of the studies and associated references are provided. Further areas of study to build on what has been learned to date are suggested, given a new and relatively undeveloped research base. Comfort care plans: a collaborative project; by Julie Young, Sue Gilbertson, Jenny Reid.: Hawker, November-December 2017, pp 18-20.
What is the best way to implement person-centred end of life care for people with dementia? The authors describe the development of "comfort care plans", which involved a partnership between Northumberland County Behaviour Support Service (NCBSS) and HospiceCare North Northumberland. They used the Newcastle Model (developed by Ian James) to support the development of the concept of comfort as a need to be met with a personalised care plan constructed around this need. Maslow's hierarchy of needs provided a structure to ensure that physical needs as well as emotional needs were identified and met. A case study illustrates how a comfort care plan works in practice. Hospice offers holistic support for individuals living with terminal illness and their caregivers. Some individuals receiving hospice services experience a slower decline in health than expected, resulting in a 'live discharge' from hospice. A live discharge affects both patient and caregiver(s). This study explored the experiences of 24 American caregivers of adults with dementia who experienced a live discharge from hospice. Findings emphasise the comprehensive services covered under the Medicare Hospice benefit and those lost after a live discharge. Implications for social workers supporting caregivers are discussed, including the need to view the patient-caregiver unit during a live discharge. (RH)

Education about end-of-life care and treatment options, communication between family and health care providers, and having advance directives and medical orders in place are important for older adults with chronic, progressive decline and end-stage disease who spend their last days in the nursing home. This US study used retrospective data (6 months before death) of long-stay nursing home decedents (N=300) taken from electronic health records to capture the end-of-life experience. Findings showed for almost all decedents, Do Not Resuscitate and Do Not Intubate orders were in place, and just over one-half had Do Not Hospitalize and No Artificial Feeding orders in place. A small proportion had No Artificial Hydration or No Antibiotic orders in place. Overall, there was congruence between documented medical orders and treatment received. Findings showed that use of hospice and discussions about particular life-sustaining treatments each had significant associations with having less aggressive medical orders in place. These results can inform best practice development to promote high quality, person-directed, end-of-life care for nursing home residents.

This qualitative study aimed to better understand long-term care (LTC) nursing staff's experience in hospice services, their perceptions of residents choosing hospice services. Also considered was understanding differences LTC nurses have experienced regarding resident deaths. The study used Interpretative Phenomenological Analysis (IPA) to extract themes and sub-themes from 10 interviews with LTC nursing staff. Content analysis was also utilised to extract one noteworthy concept, which was a comparison of two resident deaths, with and without use of hospice services. Three main themes were extracted from the data: LTC nursing participants' positive view of hospice; their perception that residents view hospice very negatively; and why residents choose hospice services. Participants also identified aspects of a "bad" or "good" death, with clear relationships noted when using hospice services. Findings identified a difference between the LTC nursing staff's positive view of hospice and their belief that their residents view hospice services very negatively. According to these nurses' experiences, to most residents, hospice meant something rather negative and feared. Therefore, an intervention which provides information about hospice services for the LTC resident population may increase the percentage of older adults who use hospice services. (RH)

Health and Social Care in the Community, vol 25, no 6, November 2017, pp 1704-1713.

Current demographic, policy and management changes are a challenge to hospices to develop their volunteering practices. A team from the International Observatory on End of Life Care and the Institute for Volunteering Research researched volunteering in British hospices, to explore good practice in volunteer involvement and to identify ways of improving care through developing volunteering. This project comprised a narrative literature review, a survey of volunteer managers, and organisational case studies selected through purposive diversity sampling criteria. A total of 205 staff, volunteers, patients and relatives were interviewed across 11 sites in England in 2012. This article focuses on one of the findings - the place that volunteers occupy between the hospice and the community beyond its walls. External changes and pressures in society were affecting volunteer management, but were viewed as requiring a careful balancing act to retain the 'spirit' of the hospice philosophy. Honouring the developmental history of the hospice was vital to many respondents, but viewed less positively by those who wished to modernise. Hospices tend to be somewhat secluded organisations in Britain, and external links and networks were mostly within the end-of-life care arena, with few referring to the wider volunteering and community fields. Volunteers were seen as an informal and symbolic 'link' to the local community, both in terms of their 'normalising' roles in the hospice, and as providing a two-way flow of information with the external environment where knowledge of hospice activities remains poor. The diversity of the community is not fully represented among hospice volunteers. A few hospices had deliberately tried to forge stronger interfaces with their localities, but these ventures were often controversial. The evidence suggests that there is substantial scope for hospices to develop the strategic aspects of volunteering through greater community engagement and involvement, and by increasing diversity and exploiting volunteers' 'boundary' position more systematically to educate, recruit and raise awareness. (RH)
Notes from the hospital bedside: reflections on researcher roles and responsibilities at the end of life in dementia; by Caroline Margaret Swarbrick, Elizabeth Sampson, John Keady.: Emerald, 2017, pp 201-211.

The authors explore some of the ethical and practical dilemmas faced by an experienced researcher in undertaking research with a person with dementia (whom they have called Amy). Amy died shortly after a period of observation had ended and the family subsequently consented to the data being shared. This individual case study presentation was nested within a larger study conducted in England and Scotland between 2013 and 2014. The overall aim of the main study was to investigate how healthcare professionals and informal carers recognised, assessed and managed pain in patients living with dementia in a range of acute settings. The presented case study of Amy raises three critical reflection points: (i) Researcher providing care, i.e. the place and positioning of compassion in research observation; (ii) What do the stories mean? i.e. the reframing of Amy's words, gestures and behaviours as (end of) life review, potentially highlights unresolved personal conflicts and reflections on loss; and (iii) Communication is embodied, i.e. the need to move beyond the recording of words to represent lived experience and into more multi-sensory methods of data capture. Researcher guidance and training about end of life observations in dementia is presently absent in the literature, and this case study stimulates debate in a much overlooked area, including the role of ethics committees. (RH)

The aim of the current exploratory study was to investigate the impact on care home staff when working with people with dementia at the end of life and to explore how they cope with this aspect of their work. With UK policy encouraging death in the place of residence rather than hospital, more people with dementia are dying in care homes. A qualitative approach was employed: 20 care home staff working in five English care homes were interviewed. Thematic Analysis was used to analyse the data. Care home staff found the external demands on them and difficulties associated with interacting with people with dementia sometimes challenging, stressful and anxiety-provoking, particularly as residents approached end of life. Emotional aspects of caring for dying residents were sometimes heightened by close attachments with residents and their families. Staff were able to recognise these unmet needs and identified a need for further training and emotional support to manage these stressors. This study revealed rich and complex understandings of the practice dimensions of caring for people with dementia at the end of life and the impact these have on staff. There is a need to develop effective psychosocial interventions that focus on emotional support for care home staff. There will be challenges in providing this in employment settings that are generally low paid, low status, have high turnover and are reliant on temporary or migrant staff, where training is not rewarded, mandatory or culturally valued. (JL)

Trajectories of care home residents during the last month of life: the case of France; by Sophie Peniec, Joelle Gaynu, Elisabeth Morand (et al.).: Cambridge University Press, February 2017, pp 325-351.

This paper examines some demographic and medical factors associated with the likelihood of residing in a care home during the last month of life for people aged 70 and over in France and, if so, of remaining in the care home throughout or being transferred to hospital. The data are from the Fin de vie en France (End of Life in France) survey undertaken in 2010. During the last month of life, very old people are more likely to be living in a care home but are not less likely to be transferred to hospital. Medical conditions and residential trajectories are closely related. People with dementia or mental disorders are more likely to live in a care home and, if so, to stay there until they die. Compared to care homes, a more technical and medication-based approach is taken in hospitals; and care home residents who are transferred to hospital more often receive medication, while those remaining in care homes more often receive support from a psychologist. In hospitals as in care homes, few older people had recourse to advance directives, and hospice programmes were not widespread. Promoting these two factors may help to increase the quality of end of life and facilitate an ethical approach to end-of-life care. (RH)
What is important at the end of life for people with dementia?: the views of people with dementia and their carers; by Sarah R Hill, Helen Mason, Marie Poole ... (et al.).: Wiley, September 2017, pp 1037-1045.

Approaching the end of life is often a time of vulnerability, particularly for people with dementia and their families where loss of capacity and the ability to communicate make assessment and shared decision-making difficult. Research has consistently shown that improvements in care and services are required to support better quality and more person-centred care for people with dementia towards and at the end of life. However the views of people with dementia about what factors contribute to high-quality care at this time are a neglected area. The aim of this study was to identify aspects of end-of-life care for people with dementia that are most important to them and their carers. Q-methodology, a mixed method combining qualitative and quantitative techniques to study subjectivity, was used to identify the views of people with mild dementia, their family carers and bereaved carers on end-of-life care. 57 participants were included in the study. Four distinct views were identified: family involvement, living in the present, pragmatic expectations and autonomy and individuality. Some areas of consensus across all views included compassionate care, decisions being made by healthcare professionals and information availability when making decisions. Overall study findings revealed several different views on what is important about end-of-life care for people with dementia. So a ‘one-size-fits-all’ approach to care is unlikely to be most appropriate. Notwithstanding the differing viewpoints, these findings could provide a framework for service providers and commissioners for future care. (JL)

What is the impact of population ageing on the future provision of end-of-life care? Population-based projections of place of death; by Anna E Bone, Barbara Gomes, Simon N Etkind (et al.).
 Palliative Medicine, 2017, 8 pp.

Population ageing represents a global challenge for future provision of health, social and end-of-life care. There has been a recent rise in the number of deaths at home (where most people would prefer to die) and a fall in deaths in hospital. However, given other new trends on place of death, where the rising number of deaths will occur in future years and the implications for health and social care will need to be examined. Using Office for National Statistics (ONS) data for England and Wales on place of registration for all deaths for 2004-2014, and predicted deaths for 2015-2040 from official population forecasts, the authors make projections on where people will die from 2015 to 2040 across all care settings. They applied age- and gender-specific proportions of deaths in hospital, care home, home, hospice and ‘other’ to numbers of expected future deaths. They estimate that annual deaths are projected to increase from 501,424 in 2014 (38.8% aged 85 years and over) to 635,814 in 2040 (53.6% aged 85 years and over). Between 2004 and 2014, the proportions of home and care home deaths both increased (18.3% to 22.9%, and 16.7% to 21.2% respectively), while hospital deaths declined (57.9% to 48.1%). If current trends continue, numbers of deaths in care homes and homes will increase by 108.1% and 88.6% respectively; and by 2040, the care home will be the most common place of death. However, if care home capacity does not expand and additional deaths occur in hospital, then hospital deaths will start to rise by 2023. Therefore, to sustain current trends, end-of-life care provision in care homes and the community needs to double by 2040. An infrastructure across care settings that supports rising annual deaths is urgently needed. Otherwise, hospital deaths will increase. (OFFPRINT.) (RH)

2016

Health and Social Care in the Community, vol 24, no 5, September 2016, pp 519-531.
The economic burden faced by family caregivers of people at the end of life is well recognised. Financial burden has a significant impact on the provision of family care-giving in the community setting, but has seen limited research attention. A systematic review with realist review synthesis and thematic analysis was undertaken to identify literature relating to the financial costs and impact of family care-giving at the end of life. This paper reports findings relating to previously developed approaches which capture the financial costs and implications of caring for family members receiving palliative/end-of-life care. Seven electronic databases were searched from inception to April 2012, for original research studies relating to the financial impact of care-giving at the
end of life. Studies were independently screened to identify those which met the study inclusion criteria, and the methodological quality of included studies was appraised using realist review criteria of relevance and rigour. A descriptive thematic approach was used to synthesise data. Twelve articles met the inclusion criteria for the review. Various approaches to capturing data on the financial costs of care-giving at the end of life were noted; however, no single tool was identified with the sole purpose of exploring these costs. The majority of approaches used structured questionnaires and were administered by personal interview, with most studies using longitudinal designs. Calculation of costs was most often based on recall by patients and family caregivers, in some studies combined with objective measures of resource use. While the studies in this review provide useful data on approaches to capturing costs of care-giving, more work is needed to develop methods which accurately and sensitively capture the financial costs of caring at the end of life. Methodological considerations include study design and method of administration, contextual and cultural relevance, and accuracy of cost estimates. (RH)

Being accepted being me: understanding the end of life care needs for older LGBT people: a guide for health and social care professionals and carers; by Kathryn Almack, University of Nottingham; National Council for Palliative Care - NCPC. London: National Council for Palliative Care, July 2016, 27 pp.
This guide aims to raise awareness of the end of life care needs of lesbian, gay, bisexual and trans (LGBT) older people, by providing information for health and social care staff and volunteers. It presents key facts on concerns about accessing health and social care services, and issues around disclosure of sexual orientation or gender identity. It includes points for discussion that could be used in training sessions. It is intended to complement the NCPC publication and DVD, ‘Open to all? Meeting the needs of lesbian, gay, bisexual and trans people nearing the end of life’. Support from the Economic and Social Research Council (ESRC) is acknowledged. (RH)

Caring for a dying spouse at the end of life: `it's one of the things you volunteer for when you get married': a qualitative study of the oldest carers' experiences; by Mary Turner, Claire King, Christine Milligan ... (et al.).: Oxford University Press, May 2016, pp 421-426.
Older people aged 80 and over are increasing providing end-of-life care to spouses at home and often do so for long periods of time, while also trying to manage their own illnesses and disabilities. Little of the research on older spousal carers has focused on the oldest carers - hence the needs of this particular population are not fully known. The objective of this study was to explore the experiences of the `oldest carers' in caring for a dying spouse at home. Secondary analysis was undertaken on a subset of data from a larger qualitative interview study. This dataset comprised 17 interviews from participants aged 80 or over. Framework analysis methods were used, with items derived from the thematic analysis of the main study. The oldest carers in this subset demonstrated high levels of resilience and the ability to adapt to their caring role. Caring until death was accepted as an integral part of the commitment made to their partner as part of the `wedding contract'. Carers felt they benefited from the support provided by family, friends and care services, however their own care needs were not always recognised by health and social care services. These findings underscore the complexity of the oldest carers' experiences and challenges in times of illness and end of life. Healthcare professionals should be alerted to the myriad ways caregiving is enacted in serious illness and seek opportunities for developing supportive interventions specifically for older carers. Detained and dying: ethical issues surrounding end-of-life care in prison; by Meredith Stensland, Sara Sanders.: Taylor and Francis, July-September 2016, pp 259-276.
Prisons are increasingly being called upon to provide end-of-life (EOL) care within the restrictive correctional environment. Several relatively recent phenomena have brought medical ethics to the forefront of prison EOL care _ including ageing behind bars, a paradigm shift in prison culture, the increasing rate of in-prison deaths, and the corresponding prison hospice movement. This article examines prominent ethical issues that emerge for prison staff who are tasked with providing care to terminally ill offenders by presenting three offender composite characters that exemplify dying offenders and emergent ethical issues surrounding their care.
Identification and critical analysis of these ethical issues demonstrate the need for strong commitment to ethical practice and highlights specific issues for prisons to examine in their own EOL care practice. (JL)

Discussing end-of-life issues with nursing home residents and their relatives is needed to ensure patient-centred care near the end of life. This study aimed to estimate the frequency of nursing home physicians discussing end-of-life issues with residents and their relatives and to investigate how discussing end-of-life issues was associated with care outcomes in the last month of life. This was a post-mortem cohort study in a nationwide, representative sample of 78 nursing home facilities in France. Residents who died from non-sudden causes between October 2013 and May 2014 in these facilities were included. End-of-life issues were discussed with at most 21.7% of the residents who died during the study period. In one-third of the situations, no discussion about end-of-life-related topics ever occurred, either with the resident or with the relatives. Older people with severe dementia were less likely to have discussed more than three of the six end-of-life topics investigated, compared with residents without dementia. In the last month of life, discussing more than three end-of-life issues with the residents or their relatives was significantly associated with reduced odds of dying in a hospital facility and with a higher likelihood of withdrawing potentially futile life-prolonging treatments. During the last months of life, discussions about end-of-life issues occurred with only a minority of nursing home decedents, although these discussions may improve end-of-life care outcomes. (JL)

End of life care: helping people to be cared for and die at home; by Alison Giles, Housing Learning and Improvement Network - Housing LIN, London: Housing Learning and Improvement Network - Housing LIN, February 2016, 14 pp (Practice briefing).

Public Health England commissioned the Housing LIN (Learning and Improvement Network) to produce this briefing. Drawing on the Housing LIN’s knowledge of the sector, it looks at the importance of end of life care delivered at home. It considers the context, inequalities in end of life care, and examples of good or emerging practice. It is intended to be a practical guide for those working in mainstream and/or specialist housing, care and support, and public health to understand their respective roles, and how they may work with each other and with the wider health care system, to help people to have their end of life care wishes met.

End of life care service for people with dementia living in care homes in Walsall; by Rachael Dutton, Nicola Beeching, Sophie Meredith, Accord Group; Pathways 4 Life; Housing Learning and Improvement Network - Housing LIN, London: Housing Learning and Improvement Network - Housing LIN, May 2016, 7 pp (Case study, 123).

Published to coincide with Dying Matters Awareness Week 2016 (9-16 May), this case study focuses on an innovative end of life care service in Walsall initiated through collaboration with Pathways 4 Life (partnership between the Accord Group and Age UK Walsall) and St Giles Walsall Hospice. The core service consists of two community-based Dementia Support Workers (DSWs) who work in care homes across Walsall in order to provide expertise, insight and knowledge to further improve dementia and end of life care. The DSWs strive to empower care home staff, people with dementia and their families through development sessions, support and guidance, along with a strong partnership working ethic. The DSWs use a range of evidence-based tools, including the ‘Namaste Care’ approach, to advance a more holistic approach to dementia and care. This involves helping to create safe and relaxing spaces, and providing a broad spectrum of meaningful person-centred activities, some suitable for using with individuals, even at the very end stages of their lives. Family caregiving and the site of care: four narratives about end-of-life care for individuals with dementia; by Anne P Glass.: Taylor and Francis, January-June 2016, pp 23-46.

Little is known about end-of-life care for individuals with Alzheimer's disease and other dementias. In this article four case studies are presented using data collected by qualitative interviews conducted with family
caregivers who were closely involved with end-of-life care for relatives with dementia. The case studies are formatted in two pairs, with one reflecting two deaths occurring at home and the other pair representing two deaths in the nursing home. The cases reveal a range of end-of-life experiences, suggesting that there is not just one ‘good’ path. The extent of care needed, the responsiveness of the individual, the health of the caregiver(s), and the residence and support situations, can all intersect in a variety of ways that make no one scenario the answer for all. Although most people say they would prefer to die at home, in some situations the nursing home can be a satisfactory choice, particularly if hospice is involved. These narrative case studies give the reader insight into the variety of the end-of-life experiences and suggest the environment should be considered as part of the care provision. (JL)

Geographic variation of inpatient care costs at the end of life; by Claudia Geue, Olivia Wu, Alastair Leyland ... (et al.).: Oxford University Press, May 2016, pp 376-381.

Costs incurred at the end of life are a main contributor to healthcare expenditure. Urban-rural inequalities in health outcomes have been demonstrated. Issues around geographical patterning of the association between time-to-death and expenditure remain under-researched. It is unknown whether differences in outcomes translate into differences in costs at the end of life. This study used a large representative sample of the Scottish population obtained from death records linked to acute inpatient care episodes. It performed retrospective analyses of costs and recorded the most frequent reasons for the last hospital admission. Using a two-part model, it estimated the probability of healthcare utilisation and costs for those patients who incurred positive costs. Effects of geography on costs were similar across diagnoses. There was not found to be a clear gradient for costs, which were lower in other urban areas compared with large urban areas. Patients from remote and very remote areas incurred higher costs than patients from large, urban areas. The main driver of increased costs was increased length of stay. These results provide evidence of additional costs associated with remote locations. If length of stay and costs are to be reduced, alternative care provision is required in rural areas. Lower costs in other urban areas compared with large urban areas may be due to urban centres incurring higher costs through case-mix and clinical practice. If inequalities are driven by hospital admission, for an end of life scenario, care delivered closer to home or home-based care seems intuitively attractive and potentially cost-saving. (JL)

A good death for the oldest old; by Miles D Witham, Jo Hockley.: Oxford University Press, May 2016, pp 329-331.

Brief article looking at ways of caring for oldest old patients at the end of life, usually aged 85 and above. A major finding of the survey was that many of these patients still die in hospital, which is unlikely to be their preferred place of death. (JL)

This is the second in a series of papers that deal with care-giving in Canada, as based on data available from Statistics Canada's General Social Survey (GSS Cycle 21: 2007). The GSS includes three modules, where respondents were asked questions about the unpaid home care assistance that they had provided in the last 12 months to someone at end of life (EOL) or with either a long-term health condition or a physical limitation. This paper uniquely examines the caregiver supports employed by EOL caregivers when compared to non-EOL caregivers (short-term and long-term caregivers combined). It builds on the authors' first paper (Health and Social Care in the Community, vol 22, no 2, pp 187-196), which reviewed the differences between short-term, long-term and end-of-life caregivers. The objective of this paper was to investigate the link between the impact of the care-giving experience and the caregiver supports received, while also examining the differences in these across EOL and non-EOL caregivers. The authors use factor analysis and regression modelling to examine differences between the two types of caregivers. The study revealed that with respect to socio-demographic characteristics, health outcomes and caregiver supports, EOL caregivers were consistently worse off. This suggests that although all non-EOL caregivers are experiencing negative impacts from their care-giving role, comparatively greater supports are needed for EOL caregivers. (RH)
Live discharge from hospice and the grief experience of dementia caregivers; by Stephanie P Wladkowski.: Taylor and Francis, January-June 2016, pp 47-62. Journal of Social Work in End-of-Life and Palliative Care, vol 12, nos 1-2, January-June 2016, pp 47-62. When an individual has dementia, family members are involved in many care transitions in their roles as caregivers. One such transition is the 'live' discharge from hospice services. This occurs when an individual no longer meets eligibility criteria. This can be difficult for caregivers who have been anticipating an end to understand the context of their grief process. This qualitative study explored the experiences of 24 caregivers of adults with dementia, including Alzheimer's disease, who experienced a 'live' discharge from hospice. Specifically, the experience of grief was examined. Results from this study highlight the complexity of caring for someone with a terminal disease and the grief experience in end-of-life care as caregivers struggle to understand the individual's terminal prognosis as temporary. This is further complicated for caregivers who must resume caregiving responsibilities or assume a new caregiving role after experiencing a loss of hospice services. Finally hospice social workers are well positioned to offer emotional and other concrete support to caregivers who experience a 'live' discharge. (JL) ISSN: 15524256 From: http://www.tandfonline.com

The stigma experienced by terminally ill patients: evidence from a Portuguese ethnographic study; by Ana Patricia Hilario.: Taylor and Francis, October-December 2016, pp 331-347. Journal of Social Work in End-of-Life and Palliative Care, vol 12, no 4, October-December 2016, pp 331-347. The aim of this study was to offer an understanding of the ways in which terminally ill patients may face discrimination due to their visibly altered body. An ethnographic approach was adopted and fieldwork was conducted over 10 months in 2 in-patient hospice units in Portugal. Participant observation was complemented by 50 in-depth interviews with terminally ill patients, family members, and hospice staff. The stigma experienced by terminally ill patients derived mostly from the behaviour of peers, extended family members, and friends toward their visibly altered body. There was no evidence that these patients were discredited by their immediate family when they became visibly unwell, unlike what has been reported in previous studies. This finding could be related to the strong familial culture of Portuguese society. (RH) ISSN: 15524256 From: http://www.tandfonline.com

We need to talk about caring: dealing with difficult conversations; by Anna Davies, Ciaran Osborne, Independent Age. London: Independent Age, July 2016, 41 pp. In April 2016, Independent Age commissioned ComRes to survey a nationally representative sample of 2,066 people online, including 520 people aged 65+, to find out about their attitudes to and experiences of different conversation topics. This report presents findings on how and why families avoid talking about challenges they may face in older age. It covers: the types of conversations taking place; the family members that are hardest to talk to; the topics that are the most difficult to talk about; and the barriers to talking about ageing. In recommending what can be done to counter the barriers to difficult conversations, it suggests ways of: addressing the information problem; addressing unwillingness to consider residential care; and addressing the denial problem. It suggests tactics for initiating sensitive conversations, on which Independent Age has launched an online resource (independentage.org/difficult-conversations). (RH) From: https://www.independentage.org/sites/default/files/2016-07/Difficult%20Conversations-%20Final%20for%20web%208_7_16_2016.pdf

What's the diagnosis?: organisational culture and palliative care delivery in residential aged care in New Zealand; by Rosemary Frey, Michal Boyd, Sue Foster (et al).: Wiley Blackwell, July 2016, pp 450-462. Health and Social Care in the Community, vol 24, no 4, July 2016, pp 450-462. Organisational culture has been shown to affect resident outcomes in residential aged care (RAC). This is particularly important, given the growing number of residents with high palliative care needs. The study described (conducted from January 2013 to March 2014) examined survey results from a convenience sample of 46 managers, alongside interviews with a purposively selected sample of 23 bereaved family members. The study aimed to explore the perceptions of organisational culture within New Zealand RAC facilities in one large urban District Health Board. Results of the Organisational Culture Assessment Instrument (OCAI) completed by managers indicated a preference for a 'Clan' and the structured 'Hierarchy' culture. Bereaved family interviews emphasised both positive and negative aspects of communication, leadership and teamwork, and relationship with residents. Study results from both managers' OCAI survey scores and next of kin interviews indicate that
while the RAC facilities are culturally oriented towards providing quality care for residents, they may face barriers to adopting organisational processes supportive of this goal. (RH)

Most people have some form of opinion about how they would like to be treated at the end of their lives, regardless of identity or background. For lesbian, gay, bisexual and transsexual (LGBT) people in particular, your identity might have an impact on the treatment and care you would like to receive. This guide aims to help you record your wishes to ensure they are respected if you cannot make a decision for yourself or tell people what you want. It provides an introduction to ways in which you can plan ahead for future treatment and care, by making a Lasting Power of Attorney for health and welfare (LPA), advance decision, or advance statement. It explains a person's rights under the Mental Capacity Act 2014, which applies in England and Wales. This guide was produced with assistance from Stonewall and Opening Doors London. (RH)

2015

The 2015 quality of death index: ranking palliative care across the world: a report by the Economist Intelligence Unit; commissioned by LIEN Foundation; by Sarah Murray, Economist Intelligence Unit - EIU. London: Economist Intelligence Unit, 2015, pp.

The Lien Foundation, a philanthropic organisation in Singapore commissioned the Economist Intelligence Unit (EIU) to devise a “Quality of Death” Index to rank 80 countries according to their provision of end-of-life care. The countries are evaluated using 20 quantitative and qualitative indicators across five categories: the palliative and healthcare environment, human resources, the affordability of care, the quality of care, and the level of community engagement. This report presents one or two case studies for each of these categories. To build the Index, the EIU used official data and existing research for each country, and also interviewed palliative care experts from around the world. As in the 2010 edition, this report finds that the UK has the best quality of death, because of the comprehensive integration of palliative care into the National Health Service (NHS) and a strong hospice movement; it also earns the best quality of care. Among other findings are that: less wealthy countries can still improve standards of palliative care rapidly, and that national policies are vital for extending access to palliative care. Quality of care depends on access to opioid analgesics and psychological support; and community efforts are important for raising awareness and encouraging conversations about death. (RH)

The 27 national organisations in the Partnership have identified six ambitions on how care for those nearing death should be delivered at local level. These are that: each person is seen as an individual; each person gets fair access to care; maximising comfort and wellbeing; care is coordinated; all staff are prepared to care; and each community is prepared to help. For each ambition, the report summarises what is already known, and the “building blocks” necessary to realise this ambition. (RH)

From: Website: http://endoflifecareambitions.org.uk/

Hospice UK and Together for Short Lives commissioned this report with the aim of learning how hospices and British Muslim communities can mutually strengthen engagement, so that hospices may provide the support needed by children and adults. Using research carried on over a 6-month period, the report looks at what is important to Muslims towards the end of life, and the barriers to engagement between hospices and Muslims in Britain. It also covers learning from national workshops, from the data, and from examples of best practice. Recommendations focus on three core areas. First, hospices and service providers should include information on religion and ethnicity in their records, to be used at registration of death and in preparing burial services. Second, hospices need to communicate and engage with local Muslim organisations, for example through community radio and television. Third, hospices, service providers and clinicians should seek specialist training programmes to better understand the “last journey” protocols and services. Joint training with mosques and
Muslim burial services would also help in understanding what is needed from when a patient dies to the completion of burial rites of passage. (RH)

Care-giving as a Canadian-Vietnamese tradition: it's like eating, you just do it; by Rhonda Donovan, Allison M Williams.: Wiley Blackwell, January 2015, pp 79-87.
This study examineD how Vietnamese family caregivers (FCGs) perceive, manage and experience end-of-life care-giving for seriously ill family members. Using an instrumental case study design, this longitudinal qualitative research employed the use of cultural brokers/language interpreters to help ensure that the research was conducted in a culturally appropriate manner. Participants (n = 18) discussed their experiences of care-giving within the context of a traditional cultural framework, which was found to influence their motivations and approaches to care-giving, as well as their propensities towards the use of various supports and services. The study was carried out in southern Ontario, Canada, and participants were providing home-based care-giving in the community. Data were collected throughout 2010 and 2011. The ways in which care-giving was perceived and expressed are reflected in three themes: Natural: identity and care work; Intentional: whole-person care; and Intensive: standards, struggle and the context of care. This research confirms the need for culturally appropriate services and supports while illustrating that Vietnamese FCGs not only value, but are also likely to use healthcare and social services if they are language-accessible, built on trust and demonstrate respect for their values as individuals, regardless of culture. End-of-life care as a field of practice in the social work curriculum; by Susan Alsop Murty, Sara Sanders, Meredith Stensland.: Taylor & Francis, January-March 2015, pp 11-26.
Attention to end-of-life care in social work education and practice is growing. With funding from the Project on Death in America, in 2001, the University of Iowa, School of Social Work developed and implemented an End-of-Life Field of Practice. Unlike a concentration, a Field of Practice is a set of integrated courses focused on one specific area of focus. This article describes the Field of Practice, the community-based partnerships, and the curriculum that serves as a basis for training the students enrolled in this area. Strategies for other social work programmes interested in developing a similar Field of Practice or speciality area in their MSW curricula are provided. These include faculty committed to the content area, comprehensive course offerings to encompass all aspects of end-of-life care, and field sites willing to help train students. (JL)

End-of-life co-residence of older parents and their sons in rural China; by Zhen Cong, Merril Silverstein.: Cambridge University Press, September 2015, pp 331-341.
The authors examined how intergenerational exchanges with sons and daughters predicted older parents' likelihood of co-residing with a son prior to death in a rural area of China's Anhui Province. Their investigation drew on theories of contingent co-residence, modernisation, and social exchange. Co-residence was conceptualised as having practical and symbolic importance in rural Chinese culture. The sample included 470 older parents, reported as deceased during 2001-2009, and their posthumous informants. Logistic regression was used to assess intergenerational support and cohesion as predictors of co-residence with a son just prior to death. Older parents who provided instrumental support to, and received instrumental support from, sons and had better emotional relationships with sons were more likely than their counterparts to co-reside with a son at the end of life. Living with sons demonstrates filial piety for older parents at the end of life, but its realization is sensitive to intergenerational transactions. (RH)

Dementia care is an increasingly important strategic consideration for palliative and end of life care providers, including hospices. However, there is a degree of uncertainty about what such care could and should encompass. This guidance for hospices seeks to assure them they have much to offer people living with dementia and their families. It offers reasons why dementia care is an important consideration for palliative and end of life care providers in the future. It considers the degree to which the hospice sector has started to acknowledge the
dementia challenge, and the principles underpinning high quality care for people with dementia, their families and carers. It uses examples of practice to illustrate the strengths of hospices: that their care is expert, flexible, timely, led by people's needs, and is integrated and provided in partnership with others. It provides checklists of what hospices must do to support people with dementia, their families and carers, for example an evidence-based approach to care and the care environment. It suggests resources to help hospices achieve high quality care for people with dementia, their families and carers. The development of this resource was funded by Hope for Home. (RH)

"I was ready to take him home": next-of-kin's accounts of loved one's death during hospice and palliative care discussions in veterans affairs medical centers; by Beverly Rosa Williams, F Amos Bailey, Hyunjin Noh ... (et al.).: Taylor & Francis, January-March 2015, pp 50-73.
This study explored next-of-kin's retrospective accounts of hospice and palliative care discussions for hospitalised veterans. In-depth, face-to-face interviews were used to generate narrative accounts of 78 next-of-kin's experience of their loved one's hospital care during the last days of the patient's life. One-third of participants reported taking part in a hospice or palliative care discussion during the patient's final hospitalisation. In over one-half of those cases, the patients died before discharge or transfer to hospice or palliative care was accomplished. Hospice and palliative care discussions in the hospital setting shaped family perceptions of the patients' care, directed family efforts in the days prior to death, and engendered anticipation of remaining quality time with the patient. Discussions about hospice or palliative care have meaning, emotional impact, practical effects and unintended consequences for next-of-kin. Social workers in hospital settings can play a critical role in supporting family members through the hospice and palliative care discussion process and facilitate timely care transitions. They also can attend to the psychosocial concerns of family members, particularly when death occurs prior to discharge to hospice or transfer to an inpatient palliative care service. (JL)

Lesbian, gay, bisexual and transgender people's attitudes to end-of-life decision-making and advance care planning; by Mark Hughes, Colleen Cartwright.: Wiley, 2015, pp 39-43.
The present study aimed to examine lesbian, gay, bisexual and transgender (LGBT) people's attitudes to advance care planning (ACP) options and alternative decision-making at the end of life. 305 LGBT people completed an online or paper-based questionnaire, comprising fixed-choice questions and open-ended questions. Most respondents, particularly those identifying as female or transgender, preferred a partner to be their alternative decision-maker at the end of life should the need arise. 52% of respondents had spoken to this person about their wishes. Regarding legal options enabling end-of-life decision-making, 29% had an enduring power of attorney, 18% an enduring guardian and 12% an advance care directive. Despite the significance of ACP for promoting the rights of LGBT people at the end of life, the take-up of these options was nearly as low as for the general population. The potential for targeted strategies to increase the take-up of ACP is identified. (JL)

Living in the end times: a short course addressing end of life issues for older people in an English parish church setting; by Joanna Collicutt.: Emerald, 2015, pp 140-149.
Working with Older People, vol 19, no 3, 2015, pp 140-149.
The author reports on a pilot study that evaluated an innovative practice in a faith community context designed to help older people live well at the end of life and to prepare for death. Evaluation was by a simple audit of the intervention using a contemporaneous journal kept by the author, and a follow-up questionnaire completed by participants. Findings indicate a high degree of engagement by participants, the establishment of a high degree of group intimacy and trust, a high level of articulation of wisdom, the emergence of significant anxiety in some isolated cases, and the use made of tea and cake to manage the transition between the existentially demanding nature of the discussions and normal life. The outcome indicated very high levels of appreciation and increased confidence in relation to issues of death and dying. The findings of the pilot have been used to inform training of clergy in the principles of working in this area (e.g. in ways of managing group dynamics and anxiety, pacing, tuning in to archetypes, and the natural symbols that people use to talk about death and dying, self-care and supervision of the programme leader/facilitator). (RH)

Public Health England's National End of Life Care Intelligence Network (NEoLCIN) works with partner organisations to collect, analyse and present end of life care intelligence from a wide variety of sources. This report summarises the key findings of the Network and its partners during 2014 on five main themes: trends and attitudes to death, dying and society; care delivery and preferences for place of care; care in different settings; support for carers and families; and the end of life care workforce. Among the findings are that: the proportion of people dying at home or in care homes continues to increase; patients with an Electronic Palliative Care Coordination System (EPaCCS) record and those receiving palliative care services such as hospice at home, Gold Standards Framework or Macmillan services are more likely to die in the place of their preference; two in five people with dementia die in hospital, indicating that the trend towards increasing hospital deaths for people living with dementia has reversed. The factors most important to people at the end of their life were: having pain and other symptoms managed effectively; being surrounded by loved ones; and being treated with dignity. More general practitioners (GPs) are having conversations with people about their end of life care wishes; but 25% still say they have never initiated such a conversation. (RH)

The national survey of bereaved people (VOICES, Views of Informal Carers - Evaluation of Services) collects information on bereaved peoples' views on the quality of care provided to a friend or relative in the last 3 months of life, for England. The survey has now been run for 4 years and was commissioned by the Department of Health in 2011 and 2012, and NHS England from 2013. VOICES data provides information to inform policy requirements, including the End of Life Care Strategy (published by the Department of Health, July 2008). This set out a commitment to promote high quality care for all adults at the end of life and stated that outcomes of end of life care would be monitored through surveys of bereaved relatives. It presents a range of information regarding a person's quality of care, the dignity and respect afforded, coordination of care, relief of pain and overall level of care in the last three months of life. Also considered are: support for relatives, friends and carers; decision-making; and preferences and choices at the end of life. Links are provided to the previous surveys.

Social work practice with LGBT elders at end of life: developing practice evaluation and clinical skills through a cultural perspective; by Darren P Arthur.: Taylor and Francis, April-June 2015, pp 178-201.

This article focuses on culturally sensitive clinical issues related to best practices with lesbian, gay, bisexual and transgender (LGBT) older dying patients at key points in the therapeutic relationship. Vital concepts, including practice evaluation and clinical skills are presented through a cultural and oncology lens. There is a paucity of LGBT research and literature as well as a shortfall of MSW graduate school education specific to social work palliative and end-of-life care (PELC) practice with LGBT older adults. The content of this article was designed to be adapted and used as an educational tool for institutions, agencies, graduate programmes, medical professions, social work and students. Learning the unique elements of LGBT cultural history and their implications on end-of-life (EOL) care can improve social work practice. (JL)

Societal costs of home and hospital end-of-life care for palliative care patients in Ontario, Canada; by Mo Yu, Denise Guerriere, Peter C Coyte.: Wiley Blackwell, November 2015, pp 605-618.

In Canada, health system restructuring has led to a greater focus on home-based palliative care as an alternative to institutionalised palliative care. However, little is known about the effect of this change on end-of-life care costs and the extent to which the financial burden of care has shifted from the acute care public sector to families. This study assessed the societal costs of end-of-life care associated with two places of death (hospital and home), using a prospective cohort design in a home-based palliative care programme. Societal cost includes all costs incurred during the course of palliative care, irrespective of payer (e.g. health system, out-of-pocket,
informal care-giving costs, etc.). Primary caregivers of terminal cancer patients were recruited from the Temmy Latner Centre for Palliative Care in Toronto, Canada. Demographic, service utilisation, care-giving time, health and functional status, and death data were collected by telephone interviews with primary caregivers over the course of patients' palliative trajectory. Logistic regression was conducted to model an individual's propensity for home death. Total societal costs of end-of-life care and component costs were compared between home and hospital death using propensity score stratification. Costs were presented in 2012 Canadian dollars ($1.00CDN = $1.00USD). The estimated total societal cost of end-of-life care was $34,197.73 per patient over the entire palliative trajectory (4 months on average). Results showed no significant difference (P > 0.05) in total societal costs between home and hospital death patients. Higher hospitalisation costs for hospital death patients were replaced by higher unpaid caregiver time and outpatient service costs for home death patients. Thus, from a societal cost perspective, alternative sites of death, while not associated with a significant change in total societal cost of end-of-life care, resulted in changes in the distribution of costs borne by different stakeholders. Spirituality and religion in end-of-life care ethics: the challenge of interfaith and cross-generational matters; by Holly Nelson-Becker, Amy L Ai, Faith P Hopp (et al.).: Oxford University Press, January 2015, pp 104-119. British Journal of Social Work, vol 45, no 1, January 2015, pp 104-119. The complexity of illness and care needs at the end of life often include religious and spiritual issues. Religion and spirituality can be important coping mechanisms for meeting these challenges. However, although many people may want spirituality incorporated as a component of their care, spiritual needs are not always recognised or supported by the existing social care and medical systems. To address the need for more information on these issues, the authors present two social work cases that draw from our clinical experiences among patients with life-limiting disease conditions. Through these cases highlighting interfaith and cross-generational family issues, they identify different ways social workers may become involved in their interactions with patients’ spiritual or religious concerns at the end of life. The authors conclude with suggestions for providing appropriate and culturally competent social and health care that promote aging in place for people with life-limiting illness conditions. (RH)

Time for action: why end of life care needs to improve, and what we need to do next; by Simon Chapman, National Council for Palliative Care - NCPC.: National Council for Palliative Care, 2015, 11 pp. Published in anticipation of the work of the Ambitions Partnership, a group of national organisations across the voluntary and statutory sectors that has come together to develop a new five-year vision and a fresh set of ambitions for end of life care over the coming Parliament. This short report elucidates four key themes which emerged from reports (published 2014 or 2015) by the Parliamentary and Health Ombudsman, the House of Commons Health Committee, and the Choice in End of Life Care Programme Board (Choice Review') on end of life care. The key themes are: the need for leadership to give end of life care greater priority; an increase in well-coordinated community-based care; support for the workforce to enable them to deliver compassionate and competent care; and fairness and equality in the access and quality of end of life care. The National Council for Palliative Care (NCPC) calls for a review into how dying, death and bereavement are dealt with across government departments and public bodies. (NH/RH)

From: www.ncpc.org.uk

What's important to me: a review of choice in end of life care; by Choice in End of Life Care Programme Board. London: Choice in End of Life Care Programme Board, 2015, 72 pp. The Choice in End of Life Care Programme Board was commissioned to provide advice to Government on improving the quality and experience of care for adults at the end of life, their carers and others who are important to them by expanding choice. This report identifies the issues people approaching the end of life are currently facing. It offers a blueprint for how greater choice in end of life care can be achieved. It looks at the context and challenge of providing end of life care. It summarises the findings of a consultation exercise with over 1,000 members of the public and professionals which looked at what kind of choices people wanted to make about their end of life care. The report makes evidence-based recommendations on what a 'national choice offer' should look like. Short case study examples are included throughout. The review also recommends that: 24/7 end of life care for people being cared for outside hospital should be in place across England by 2019; everyone in need of end of life care should have a named senior clinician responsible for their care and preferences and their own care coordinator; a clear Government policy to make access to social care for people at the end of life fast and free; and more honest and open communication about end of life issues, with better
support for health and care professionals and increased awareness raising amongst the public. A final section provides advice to Government on the steps that will need to be put in place to deliver choice in end of life care. (RH)

2014

Health and Social Care in the Community, vol 22, no 3, May 2014, pp 290-299.

Despite the benefits of advance care planning (ACP), international research has suggested that in pluralistic and multicultural societies such as New Zealand, significant differences exist in the uptake of ACP between European-based populations and other cultural groups (L M Crawley, 2005). This study explores the views of generalist palliative care providers in both the community and hospital settings regarding the barriers to ACP adoption as well as methods to increase knowledge about ACP among Maori, Pacific and Asian cultural groups within New Zealand society. Eleven individual interviews, two joint interviews, and three focus groups were conducted with health and social care professionals with a wide range of knowledge and experience in palliative care. Challenges were related to a number of issues based on culture, including family decision-making style, a need to 'do everything', and a reluctance to discuss issues surrounding dying and death. Suggestions to increase the knowledge of ACP included techniques to improve information access and the utilisation of shared norms and values to assist with discussions between Maori, Pacific and Asian health professionals and their patients and families or whanau. Findings indicate a need for more family- or whanau-centred models of ACP to be considered much earlier in the healthcare process and within the community setting.

Barriers to the provision of high-quality palliative care for people with dementia in England: a qualitative study of professionals’ experiences; by Nathan Davies, Laura Maio, Krish Vedavanam, Jill Manthorpe (et al.).: Wiley Blackwell, July 2014, pp 386-394.

Health and Social Care in the Community, vol 22, no 4, July 2014, pp 386-394.

Approaches to palliative care that were originally developed for people with cancer are now being adopted for people with dementia, as a response to many reports of poor-quality care for people with dementia at the end of life. This study explored perceived barriers to the delivery of high-quality palliative care for people with dementia using semi-structured interviews. Recordings were transcribed verbatim and analysed using thematic analysis with an inductive approach and a coding strategy. To improve the trustworthiness of the analysis, independent reading and coding of the transcripts were undertaken, followed by discussions among the four researchers to reach agreement and consensus of the themes. Two group interviews (n = 7 and n = 6), 16 individual interviews and five interviews of pairs of professionals were conducted in 2011/2012 with participants from backgrounds in palliative care, dementia services, palliative care research and policy making. Four themes were identified as barriers to providing high-quality palliative care for people with dementia: (i) ambivalence towards the systematisation of palliative care; (ii) disconnection between services; (iii) different assumptions about training needs; and (iv) negotiation of risk. Understanding these barriers to providing high-quality palliative care for people with dementia could help in the development of a dementia-specific palliative care pathway. (RH)

This is a comprehensive introduction to aged care for the nursing profession in clinical practice, which encourages practice with a focus on individuals' potential and capacities rather than their limits. Theories of ageing are linked with the older individual's strengths. Divided into three parts, the book presents the topic from perspectives ranging from healthy ageing to chronic illness, frailty and end of life care. Case studies combine evidence-based knowledge with practical examples in a number of aged care settings, principally in Australia and New Zealand. (RH)

This study explores the extent to which a palliative approach was being used in the organisation and provision of care for older people with complex needs living in mixed-level (a combination of low- and high-level care) residential aged care facilities (RACFs) in Australia. It also explores whether evidence-based guidelines developed in 2004 were used. This paper primarily reports on the qualitative findings. Two residential aged care organisations, one in rural New South Wales and the other in Sydney, Australia, participated. Data were collected over a 9-month period from May until December 2008. Residents, family members and aged care staff were interviewed. Thematic analysis of participant interviews shows that while the various elements of a palliative approach are incorporated into the care of high-level care residents, the discourse itself is not used. The authors argue for a new conceptualisation of care for people in mixed-level care facilities: a community-of-care, in which a palliative approach is one of several components of the care provided. The findings illuminate aged care staff experiences of providing care to high-level care residents. They also provide valuable insights into high-level care residents' perceptions of their health, care provided and the way in which they foresee their care being provided in future. These findings will be important for informing clinical practice, research and policy in these settings. (RH) ISSN: 09660410

Place of death is an important component of the quality of a person's death. This study undertook a systematic review and narrative synthesis of the literature concerning place of death of people with dementia and their preferences for location of death, and of the family carers and healthcare providers preferences about location of death for patients with dementia. Studies relying on death certificate data show that patients with dementia die more commonly in care homes than other locations, contrasting with prospective studies which show that death is more common in own residence and hospital. Age (older), gender (male), availability of hospital and nursing home beds and enrolment in hospice, influence place of death. There is very limited evidence of patients, family carers and healthcare providers' views on preferred location of death for patients with dementia; and the only study included reported that family carers' views are more agreed to rather than patients' own views regarding place of death. This study on place of death raises exploratory questions on end-of-life care for patients with dementia, which has implications on health and social care policies related to dementia. Duty to care?: supporting and involving unpaid carers of people at the end of life; by National Council for Palliative Care - NCPC. London: National Council for Palliative Care, 2014, 26 pp. The Care Bill (2013) proposes that carers in England will have a right to an assessment by local authorities based on the appearance of need. This is a discussion document based on a conference held on 10th October 2013. It is also a teaching aid based on three scenarios discussed in workshops at the conference, which are also suited for use in training and development in the workplace. The scenarios are on these themes: culture, context and capability; capacity, collusion and choice; and conflict, confidentiality and crisis. The document was produced with supported by the Wellcome Trust and Dying Matters, in partnership with the Carers Trust, Marie Curie Cancer Care, Help the Hospices, Macmillan Cancer Support, and Sue Ryder. (RH) Price: £5.00

The goals of this study were to describe end-of-life care costs of older people with dementia (OPWD) residents in care homes (CHs) with no on-site nursing and evaluate the economic case for an intervention designed to improve end-of-life care for OPWD in CHs. Phase 1 tracked for a year, from March 2009, health services received by 133 OPWD in six residential CHs in the East of England. CH and resident characteristics were obtained through standardised assessment tools, interviews with CH managers and publicly available information from the independent regulator of social care services in England. Phase 2 used a modified Appreciative Inquiry intervention that ran for six months from January 2011, in three of the six CHs. Wilcoxon
matched-pairs sign-rank tests were conducted to compare total cost and cost components during Phases 1 and 2 for those residents who had participated in both. Costs for each resident in Phase 1 were about £2800 per month, including service, accommodation and medication. Resource use was associated with resident characteristics. The intervention was perceived as having a positive impact on working relationships between CHs and visiting health care practitioners. Following the intervention total service costs fell by 43%. Hospital care costs fell by 88%. These results represent early work in an under-researched area of care. Appreciative Inquiry appears to improve and change working relationships with promising outcomes, but more research is needed to test these findings further with larger samples and more robust controls. This study examined care managers’ perspectives on facilitating advance care planning (ACP) with ethnically diverse older people enrolled in Wisconsin Family Care, a care programme that coordinates medical and long-term care for frail, poor older people. Seven in-depth interviews and two focus groups were conducted with 24 lead supervisors and care managers of care management teams between July and August 2008; data were analysed with qualitative thematic analysis method. Participants identified four main sources of challenges: death and dying are taboo discussion topics; the dying process is beyond human control; family and others hold decision-making responsibility; and planning for death and dying is a foreign concept. Participants’ recommendations coping with these challenges were to: develop trust with elders over time; cultivate cultural knowledge and sensitivity to respect value orientations; promote designating a healthcare proxy; recognise and educate families and community leaders as critical partners in ACP; and provide practical support as needed throughout the illness experience. These findings suggest important practice implications for care managers working with increasingly diverse cultural groups of older people at the end of life. (RH)

Impact of community based, specialist palliative care teams on hospitalisations and emergency department visits late in life and hospital deaths; a pooled analysis; by Helen Seow, Kevin Brazil, Jonathan Sussman (et al). BMJ 2014;348:g3496, 6 June 2014, 10 pp.
This pooled analysis of an Ontario, Canada retrospective cohort study found that 3109 patients treated by 11 community based specialist palliative care teams had a reduced risk of being in hospital or having an emergency department visit in the last 2 weeks of life compared to 3109 patients receiving usual care. The palliative care teams studied served different geographies and varied in team composition and size, but had the same core team members and role: a core group of palliative care physicians, nurses and family physicians who provided integrated palliative care to patients in their homes. The teams role was to manage symptoms, provide education and care, coordinate services, and be available without interruption regardless of time of day. In both care groups, about 80% had cancer and 78% received end of life homecare services for the same average duration. Across all palliative care teams (970 (31.2%) of the exposed group were in hospital and 896 (28.9%) had an emergency department visit in the last two weeks of life respectively, compared with 1219 (39.3%) and 1070 (34.5%) of the unexposed group. Despite variation in team composition and geographies, community based specialist palliative care teams were effective in reducing acute care use and hospital deaths at the end of life. LGBT people's knowledge of and preparedness to discuss end-of-life care planning options; by Mark Hughes, Colleen Cartwright.: Wiley Blackwell, September 2014, pp 545-552.
Health and Social Care in the Community, vol 22, no 5, September 2014, pp 545-552.
Despite the devastating impact of HIV/AIDS, end-of-life care planning among lesbian, gay, bisexual and transgender (LGBT) communities is relatively under-researched. This article reports findings of a survey of 305 LGBT people living in New South Wales, Australia, which examined their knowledge of and attitudes towards end-of-life care, specifically their preparedness to discuss any care plan with healthcare providers. The results highlight that while most respondents were aware of three of the four key end-of-life care planning options available in New South Wales - enduring powers of attorney, enduring guardians and person responsible (only a minority had heard of advance healthcare directives) - a much smaller number of people had actually taken up these options. Only a minority of respondents were able to identify correctly who had the legal right to make treatment decisions for a person who is unconscious following a car accident. A small proportion of people had discussed end-of-life care options with general practitioners or another main healthcare provider, and only in very few cases were these issues raised by the practitioners themselves. Those most likely to not feel comfortable discussing these issues with practitioners included younger people, those not fully open about their sexuality to family members, and transgender people and others who do not define their gender as male or female. The paper highlights the importance of education strategies to raise awareness of the end-of-life care planning options among LGBT people, as well as strategies for increasing health providers' preparedness to discuss these issues with LGBT patients. Health and Social Care in the Community, vol 22, no 1, January 2014, pp 22-29.
Care homes with no on-site nursing provision rely on primary care services for access to medical, nursing and specialist services. This study describes the expectations and experiences of end-of-life care of older people resident in care homes, and how care home staff and the healthcare practitioners who visited the care home interpreted their role. A mixed-method design was used. The everyday experience of 121 residents from six care homes in the East of England were tracked; 63 residents, 30 care home staff with assorted roles and 19 National Health Service staff from different disciplines were interviewed. The review of care home notes demonstrated that residents had a wide range of healthcare problems. Length of time in the care homes, functional ability or episodes of ill-health were not necessarily meaningful indicators to staff that a resident was about to die. General Practitioner (GP) and district nursing services provided a frequent but episodic service to individual residents. There were two recurring themes that affected how staff engaged with the process of advance care planning with residents: 'talking about dying', and 'integrating living and dying'. All participants stated that they were committed to providing end-of-life care and supporting residents to die in the care home, if wanted. However, the process was complicated by an ongoing lack of clarity about roles and responsibilities in providing end-of-life care; and doubts from care home and primary healthcare staff about their capacity to work together when residents' trajectories to death were unclear. The findings suggest that to support this population, there is a need for a pattern of working between health and care staff that can encourage review and discussion between multiple participants over sustained periods of time. Residential aged care: the de facto hospice for New Zealand's older people; by Martin J Connolly, Joanna B Broad, Michal Boyd ... (et al).: Wiley, June 2014, pp 114-120.
Australasian Journal on Ageing, vol 33, no 2, June 2014, pp 114-120.
The present study aimed to describe short-term mortality among residential aged care (RAC) residents in Auckland, New Zealand. This was a census-type survey of all residential aged care facilities in the Auckland
region, conducted during 2008. 861, or 12.6% of participants died within six months of taking the survey. Survival related to RAC length of stay before the survey: those resident for less than one month (subgroup 380) having 80.0% survival, 1-6 months 83.2% and six or more months 87.4%. In those admitted to private hospital from acute hospital (104 of the subgroup of 380), six-month mortality was 36.5%. Significant mortality predictors were: private hospital admission from acute hospital, unscheduled GP visit during the prior two weeks, personal care disability and acute hospital admission during the previous two years. These findings show that RAC mortality (especially post admission) is high. Training and resource in the sector should reflect this. (JL)

This paper outlines an approach to understanding later life issues through the conceptual framework of "transitions". The paper draws on a wide-ranging review of the literature, supported by two workshop sessions involving key stakeholders and experts in the field. It analyses the efficacy or otherwise of the support available for people undergoing these major transitions: retirement; becoming a carer; acquiring a health condition; and preparing for end of life. It comments on key issues relating to these transitions: resilience, personal capabilities, and community support. The study derives its data largely from a review of published literature, and therefore lacks the input from older people themselves. The analysis provides guidance to policy makers and others interested in the later life agenda with well-researched recommendations for change. There are significant social implications in the recommendations and the opportunity for the experiences in later life to be framed in a transitions paradigm. (RH)

The purpose of this paper was to discuss integrated working between the arts and those in care settings. This was a conceptual discussion drawing upon insights from relevant literature and a case study analysis of an integration project between a hospice service, an art gallery and an artist. The project, known as Life:Still, highlighted some points about a lack of conceptual frameworks to help locate the purpose of diverse arts and care projects. There is scope for much confusion about the nature and purpose of such integration projects without a clear framework for articulating the aims of individual integration endeavours and their place in relation to other arts and care work. This paper develops a framework and a clear understanding about the different kinds and goals of integrated working between arts and care settings to help with future practical and research projects. In particular the case study highlights key themes from which generalisation to other services will require interpretation for particular contexts. The ideas present a helpful approach to articulating the goals of individual projects and understanding the place of projects in relation to other arts and care initiatives. There is much scope for better integrated working between arts and care settings to achieve better outcomes for users of care services, and the ideas presented here should help to better organise and evaluate such developments. This is the first paper to set out the framework presented to help with better integrated working between arts and care settings. (JL)

10 questions to ensure good end of life care in your area; by Simon Chapman, Dying Matters Coalition; National Council for Palliative Care - NCPC; Marie Curie Cancer Care. London: National Council for Palliative Care; Marie Curie Cancer Care, 2013, 18 pp.

This document is published with the implementation of health and social care reforms in April 2013 and how they are made to work for the benefit of people approaching the end of life and the people caring for them. It asks why each of the ten questions is important, what else to ask, and suggests further information sources.

Local provision on end of life care is considered with questions about: where people are dying and where they are being cared for before they die; the quality of care received; the systems that identify people approaching the end of life and how plans about care can be coordinated; services “at any time of day and night” to enable people to be cared for in the place they want to be; support for carers, including into bereavement; services that are genuinely available and accessible to all; training in end of life care for staff; end of life care as a priority, including leadership and accountability; raising public awareness about death, dying and bereavement; and involving local people and those with personal experience in shaping and evaluating services. Anticipatory grief therapy for older persons nearing the end of life; by Joanna O Y Cheng, Raymond S K Lo, Jean Woo..: Future Medicine, February 2013, pp 103-114.

Aging Health, vol 9, no 1, February 2013, pp 103-114.

Ageing brings about multiple and accumulating losses over a long trajectory of illness with deterioration in overall functioning with secondary losses in social and existential domains. The reality of anticipatory grief (AG) in older patients facing the end of life is easily overlooked with little provision of psychosocial support, especially for those ageing in institutions without integrated palliative care services. This article discusses the challenges that AG poses for the older patients, as well as the desired therapeutic outcomes through using this approach. The evidence base for AG therapy has been limited. Beneficial therapeutic approaches for AG-related constructs are reviewed, with recommendations to design interventions that target the AG of older patients facing different advanced conditions. AG interventions successfully implemented in the end-of-life care pathway may ensure optimal palliative care for the family. (JL)

Quality in Ageing and Older Adults, vol 14, no 3, 2013, pp 205-217.

The author traces the history of official policy on the regulation of care homes in respect of end of life care, also what is required to support care home staff in relation to dying residents and their relatives. A central concern is to argue for the open recognition that care homes now cater primarily for frail people towards the end of their lives. Good end-of-life care and a good death could become a positive “selling point”. The author concludes that the system of regulation has broadly failed to address a good death or good end of life care in a residential home. Death talk should no longer need to be avoided in care homes. The research suggests that appropriate support for care home staff in relation to dying residents needs careful identification and investment. A cultural shift is required. Following a review of policy documents on regulation and standards of care in residential homes and a subsequent review of the research literature on death and dying in care homes, the paper illuminates the contrast between the ambitious aims in policy documents with very varied practice in everyday care of frail residents. The recent systems of regulation have broadly failed to address a good death or good end-of-life care in residential homes. Open acknowledgement of death and dying should not be avoided in care homes. Appropriate support for care home staff in relation to dying residents needs careful identification and
investment. The focus of this paper is to contrast official policy with everyday practice. Whilst policy documents suggest recognition of the importance of dignity and respect from dying residents, the research literature indicates great variation in the practice of everyday care. (RH)

Decriminalising an expected death in the home: a social work response; by Margaret E Hughes.: Oxford University Press, March 2013, pp 282-297.

An issue yet to be examined in the social work research literature concerns an expected death at home and the experiences of informal carers being subjected to a police investigation following a request for help. While research in this area is scant, sufficient mention of unnecessary police involvement is made in the palliative care literature to show that incidents like these have occurred throughout Australia, America, Canada and the UK. This article examines the Australian context, analysing the practice of reporting deaths to the police in instances where a doctor is not immediately available to attend the home to certify the death of a person diagnosed with a terminal condition. Personal accounts from three research participants derived from a subset of data analysed for a larger qualitative study are used as empirical evidence to illuminate the impact of unnecessary police involvement. Using critical social work theory to examine unnecessary end-of-life intervention, this paper argues for greater social work activity within the context of home-based palliative care, so that the rights of informal carers to relevant information is improved, and expected deaths at home are no longer considered crime scenes warranting police investigation. Developing emotional competence of social workers of end-of-life and bereavement care; by Amy Y M Chow.: Oxford University Press, March 2013, pp 373-393.

Facing an excessive number of deaths and the intense emotions of bereaved family members, social workers who work with dying and bereaved persons are confronted with exceptional emotional challenges. Based on two models of death anxiety, an education programme was developed with different experiential exercises with the aim of enhancing the emotional competence of social workers in Hong Kong. Through working with regrets and meaningfulness, the programme aims at reducing personal death anxiety, hopefully reducing the distress and non-empathetic responses of the social workers. An effectiveness study with 385 participants was carried out. Data were collected at three time points (pre, post and follow-up) to capture the changes over time. The programme is considered successful as, according to the statistics gathered, the major outcomes of work comfort and competence level improved. Statistically significant changes across time were found in death anxiety and meaningfulness. Moreover, correlations were found between death anxiety and competence and comfort level. It is anticipated that the programme can be used and tested by social work educators and other helping professionals in other parts of the world. (JL)

Development and evaluation of the REACH (Recognise End of life And Care Holistically) out in Dementia toolkit; by Jan M Potter, Ramesh Fernando, Nancy Humpel.: Wiley Blackwell, December 2013, pp 241-246.

The purpose of the study was to identify evidence based signs and symptoms indicative of end stage dementia, and develop the REACH (Recognise End of Life and Care Holistically) toolkit as an aid for staff to consider a palliative approach. A systematic literature review was conducted of policy, position documents, guidelines and publications from 1988 to 2011. Inclusion criteria were any report or article identifying the signs and symptoms of end stage dementia which were associated with increased mortality and morbidity. Eight signs and symptoms associated with worsening function and increased mortality were identified. These were: dependence on others
for all activities of daily living; communication difficulties; eating and/or feeding difficulties; deterioration in mobility and posture; development of contractures because of muscle rigidity; persistent confusion; recurrent infections; and inability to recognise familiar objects or family and friends. All these were incorporated into a toolkit which was reviewed by experienced clinicians. The toolkit was then trialled in six aged care facilities (ACFs). As a result 182 residents with dementia were identified as being at the end stage. Overall study findings of the study showed that use of the toolkit improved the recognition of end stage dementia among staff in ACFs. (JL)

End-of-life care in a rehabilitation centre for older people in Australia; by Heather Tan ... (et al.).: Wiley Blackwell, September 2013, pp 184-187.
The purpose of this study was to investigate processes at the end of life for patients who died in a subacute evaluation and management facility for older people. A retrospective chart audit for 55 patients who had died in the previous two years was undertaken, recording a number of significant variables. Despite diagnosis of comorbid medical conditions, most participants were admitted for improved functioning or assessment for alternative accommodation. Consistent with this focus, the key contact person was most often an allied health team member. Not For Resuscitation order and/or power of attorney documents on admission were uncommon, as were referrals to palliative care specialist staff, although an end-of-life discussion was recorded (90%) and often included as a new goal of care (71%). Factors likely to improve end-of-life care included advance care planning, earlier recognition of short prognosis and staff education. (JL)

Improving the end-of-life for people with dementia living in a care home: an intervention study; by Gill Livingston ... (et al.).: Cambridge University Press, November 2013, pp 1849-1858.
International Psychogeriatrics, vol 25, no 11, November 2013, pp 1849-1858.
One in three adults, most of whom are living in a care home at the time, dies with dementia. Their end-of-life is often in hospital, where they may experience uncomfortable interventions without known benefit and die rapidly with uncontrolled pain and comfort needs. This study aimed to improve end-of-life care for people with dementia in a care home by increasing the number and implementation of advanced care wishes. The study recruited staff, residents with dementia, and their relatives from a 120-bed nursing home in London. The intervention was a ten-session manualised, interactive staff training programme. The study compared advance care wishes documentation and implementation, place of death for residents who died, and themes from staff and family carers' after-death interviews pre- and post-intervention. Post-intervention there were significant
increases in documented advance care wishes arising from residents’ and relatives’ discussions with staff about end-of-life. These included do not resuscitate orders and dying in the care homes as opposed to hospital. Bereaved relatives’ overall satisfaction increased from 7.5 pre-intervention to 9.1 post-intervention. Relatives reported increased consultation and satisfaction about decisions. Staff members were more confident about end-of-life planning and implementing advanced wishes. This small non-randomised study is the first end-of-life care in dementia intervention to report an increase in family satisfaction with a reduction in hospital deaths. This is promising but requires further evaluation in diverse care homes. (JL)

Living and dying with dignity in Chinese society: perspectives of older palliative care patients in Hong Kong; by Andy Hau Yan Ho, Cecilia Lai Wan Chan, Pamela Pui Yu Leung ... (et al.).: Oxford University Press, July 2013, pp 455-461.

The empirical Dignity Model has profoundly influenced the provision of palliative care for older terminally ill patients in the West as it provides practical guidance and intervention strategies for promoting dignity and reducing distress at the end of life. The present study aimed to examine the concept of living and dying with dignity in the Chinese context, and to explore the application of the Dignity Model to older terminal patients in Hong Kong. Using qualitative interviews, the concept of dignity was explored among 16 older Chinese palliative care patients with terminal cancer. Framework analysis with both deductive and inductive methods was employed. Results showed that the three major categories of themes of the Dignity Model were broadly supported. However the subtheme of death anxiety was not supported, while two subthemes of generativity/legacy and resilience/fighting spirit manifested differently in the Chinese context. Furthermore four new emergent themes have been identified. They include enduring pain, moral transcendence, spiritual surrender and transgenerational unity. These findings highlight both a cultural and a familial dimension in the construct of dignity, underline the paramount importance of cultural awareness and competence for working with ethnically diverse groups, and call for a culturally sensitive and family oriented approach to palliative care interventions with older Chinese terminal patients. (JL).

Health and Social Care in the Community, vol 21, no 5, September 2013, pp 530-535.

As a home death seems to be the perceived ideal, terminally ill people who live alone are at a disadvantage in terms of their place of care and death, and little is known about their end-of-life preferences. This study aimed at eliciting patient preferences for their place of care and death longitudinally at two points during their illness trajectory, and reporting on the extent they were able to achieve their place of choice or congruence between preferred and actual place of death. A questionnaire was administered by a researcher in the patients’ homes during two visits, 6-12 weeks apart depending on patient prognosis. Forty-three patients of Silver Chain Hospice Care Service in Western Australia participated during 2009-2010. The results indicate that preferences were in favour of either a home or hospice death, with more preferring home as a place of death rather than a place of care. However, overall congruence between preferred and actual place of death was between 53% and 41% dependent on whether it was based on first or second visit preferences respectively. This is the first longitudinal study to elicit the end-of-life preferences of terminally ill people who live alone. As home may not be the preferred location for dying for many patients (nearly half of the patients in this study), ability to die in the place of choice needs to be looked at as a possible indicator of meeting patient needs or as a quality measure in end-of-life care. (RH)

Developed from a model of care successfully used in hospices, the Liverpool Care Pathway for the Dying Patient (LCP) is a generic approach to care for the dying, intended to ensure that uniformly good care is given to everyone thought to be dying within hours or within two or three days, whether they are in hospitals, nursing homes, or in their own homes. Following criticism of the LCP in the media and elsewhere, Norman Lamb, Minister of State for Care Support, asked Baroness Julia Neuberger to chair a panel to review of the use and experience of the LCP in England, to be kept independent of Government and the NHS. This report presents the Independent Review's findings and recommendations in respect of: diagnosis of dying; decision-making;
Professional and educational needs of hospice and palliative care social workers; by Sherri M Weisenfluh, Ellen L Csikai.: Taylor and Francis, January-March 2013, pp 58-73. Journal of Social Work in End-of-Life and Palliative Care, vol 9, no 1, January-March 2013, pp 58-73. In recent years the number of patients and families served by hospices and palliative care services has increased. These services have also been subject to increasing regulation by government. In order to stay up-to-date in this ever-changing environment and to continue to provide effective interventions social workers must stay engaged in the professional community and continuing education. In this quantitative study 1,169 practising hospice and palliative care social workers provided information about their practice activities and agency characteristics, professional affiliations and certification, and ongoing educational needs. About one-half of respondents carried a caseload of 21-50 and were mostly engaged in communicating the psychosocial needs of the patient and family to other members of the team and assessing for grief and bereavement issues. The most important educational needs pertained to the psychological and social needs of patients and families and psychosocial interventions. Although many were aware of the joint NASW-NHPCO social work hospice speciality certification few held this certification yet. The authors conclude that the results of this survey could be used in the design of continuing education programmes and advocacy for policy change. The public's viewpoint on the right to hastened death in Alberta, Canada: findings from a population survey study; by Donna M Wilson, Stephen Birch, Rod MacLeod ... (et al.).: Wiley, March 2013, pp 200-208. Health and Social Care in the Community, vol 21, no 2, March 2013, pp 200-208. A research study was conducted to determine public opinion in Alberta, Canada, on the controversial topic of death hastening. Questions on the right to hastened death, end-of-life plans and end-of-life experiences were included in the Population Research Laboratory's annual 2010 health-care telephone survey, with 1,203 adults providing results relatively representative of Albertans. Of all 1,203, 72.6% said yes to the question: 'Should
Quality of dying of nursing home residents with dementia as judged by relatives; by Nicole van Uden ... (et al.).: Cambridge University Press, October 2013, pp 1697-1707.

Providing good quality care for the growing number of patients with dementia is a major challenge. There is little international comparative research on how people with dementia die in nursing homes. This study compared the relative's judgment on quality of care at the end of life and quality of dying of nursing home residents with dementia in Belgium and the Netherlands. This was a Belgian cross-sectional retrospective study (2010) combined with a prospective and retrospective study from the Netherlands (January 2007-July 2011).

Relatives of deceased residents of 69 Belgian and 34 Dutch nursing homes were asked to complete questionnaires. The study included 190 and 337 deceased nursing home residents with dementia in Belgium and the Netherlands respectively. Of all identified deceased nursing home residents with dementia, respectively 53.2% and 74.8% of their relatives in Belgium and the Netherlands responded. Comfort while dying was rated better for Dutch nursing home residents than for Belgian nursing homes residents. No differences were found between countries regarding satisfaction with care or symptom frequency in the last month of life. Although nursing home structures differ between Belgium and the Netherlands, the quality of care in the last month of life for residents with dementia is similar according to their relatives. However, Dutch residents experience less discomfort while dying. The results suggest room for improved symptom management in both countries and particularly in the dying phase in Belgium. (JL)

Reaching the whole community?: end of life care for all who need it; by National Council for Palliative Care - NCPC. London: National Council for Palliative Care, 2013, 19 pp.

This report sets out the emerging priorities and themes highlighted at a national conference held on 18th April 2013, organised by the National Council for Palliative Care (NCPC) and the Dying Matters coalition. It provides some key facts about current access to end of life care; and considers those who might be labelled “hard to reach” (minority ethnic communities, and lesbian, gay, bisexual and transgender, or LGBT, for example). It concludes with some good practice examples, also lists of discussion documents and websites. (RH)

The role of healthcare support workers in providing palliative and end-of-life care in the community: a systematic literature review; by Oliver R Herber, Bridget M Johnston.: Wiley Blackwell, May 2013, pp 225-235.

Despite the widespread use of Health Care Support Workers (HCSWs) in providing palliative and end-of-life care, there is little information available about their contributions towards supporting patients who want to be cared for and/or die at home. Between January and April 2011, a systematic review was conducted to address two questions: (i) What particular tasks/roles do HCSWs perform when caring for people at the end of life and their families to comply with their desire to remain at home?; (ii) What are the challenges and supporting factors that influence HCSWs' ability to provide palliative and end-of-life care in the community? A search was carried out for papers published from 1990 to April 2011. In total, 1,695 papers were identified, ten of which met the eligibility criteria of the study. After the methodological quality of the studies was appraised, nine papers were included in the review. The findings indicated that HCSWs invest a great deal of their time on emotional and social support as well as on assisting in the provision of personal care. They are also involved in providing care...
for the dying, respite care for family members and offer domestic support. Although it is important to acknowledge the many positive aspects that HCSWs provide, the findings suggest three challenges in the HCSWs role: emotional attachment, role ambiguity and inadequate training. Support factors such as informal peer grief-support groups, sense of cohesiveness among HCSWs and task orientation enabled HCSWs to overcome these challenges. To conclude, induction and training programmes, a defined period of preceptorship, appropriate support, supervision and clearly defined role boundaries may be helpful in reducing the challenges identified in HCSWs' roles. Ways and means; by Ally Paget, Claudia Wood, Demos. London: Demos, 2013, 150 pp. The quality of care experienced at the end of life is frequently characterised by delays, a lack of information and insufficient consideration given to the wishes of patient and family to achieve "a good death". This report was developed by Demos for Sue Ryder, to explore the quality of the patient experience of end of life care services, and what can be done to improve this journey through the different fields of health and social care from the patient's perspective. Early diagnosis, a high level of personalisation and ongoing seamless support are crucial to delivering a good service and reducing inequalities in end of life care. (Note: On title page: "People's final journey must be one of their choosing ...") (RH)

What are the priorities for developing culturally appropriate palliative and end-of-life care for older people?: the views of healthcare staff working in New Zealand; by Gary Bellamy, Merryn Gott.: Wiley, January 2013, pp 26-34.

Health and Social Care in the Community, vol 21, no 1, January 2013, pp 26-34.

In New Zealand, the ageing population is culturally and ethnically diverse; and, along with other developing countries experiencing high levels of migration, the challenge is how to balance the rise in numbers of older people from difference ethnic and cultural groups with end-of-life care that reflects personal values and beliefs. This study investigated the views of healthcare staff regarding the provision of culturally appropriate palliative care for Maori, Pacific Island and Chinese elders living in Auckland, New Zealand. Two joint interviews and ten focus groups were conducted with eighty staff across a range care settings in 2010. Findings indicate that participants viewed the involvement of family as fundamental to the provision of palliative care for Maori, Pacific Island and Chinese elders. For Maori and Pacific Islanders, healthcare staff indicated the importance of enabling family members to provide 'hands-on' care. The role of family in decision-making was fundamental to the delivery of, and satisfaction with care for older Chinese family members. Care staff highlighted the need to be cognisant of individual preferences both within and across cultures as a fundamental aspect of palliative care provision. While assumptions are sometimes made about preferences for end-of-life care based on cultural values alone, the results suggest that care preferences need to be ascertained by working with family members on an individual basis and in a manner that respects their involvement in palliative care provision. Where do I go from here?: a cultural perspective on challenges to the use of hospice services; by Rosemary Frey, Merryn Gott, Deborah Raphael (et al.).: Wiley Blackwell, September 2013, pp 519-529.

Health and Social Care in the Community, vol 21, no 5, September 2013, pp 519-529.

Do hospice services as shaped by a western perspective adequately fulfil the needs of persons from non-Western cultures? Based on a Western view of palliative care, the vision outlined in the New Zealand Palliative Care Strategy (2001) is to deliver palliative care services, including hospice services, to all patients and their families requiring them in the context of an increasingly pluralistic and multicultural society. It is predicted that over the next two decades the proportion of people in New Zealand identifying as Maori, Pacific and Asian will dramatically increase. Ministry of Health information provided through a GAP analysis identified hospices as facing access-to-care pressures for Maori, Pacific and Asian patients. It is therefore critical to identify the challenges to hospice service access for Maori, Asian and Pacific patients. This project involved qualitative interviews with 37 cancer patients (Maori, Pacific and Asian self-identified ethnicities), whanau/family and bereaved whanau/family, as well as 15 health professionals (e.g. referring GPs, oncologists, allied health professionals) within one District Health Board. Patients and their families included both those who utilised hospice services, as well as those non-users of hospice services identified by a health professional as having palliative care needs. Challenges to hospice service utilisation reported included a lack of awareness in the communities of available services, as well as continuing misconceptions concerning the nature of hospice services. Language barriers were particularly reported for Asian patients and their families. Issues concerning the ethnic representativeness of the hospice services staff were raised. The findings highlight the importance of
patient and family knowledge of hospice care for utilisation of services. This information can be used for future planning to enable hospices to both provide high quality evidence-based palliative care services for patients and families, and to provide consultative services to primary healthcare providers in the community. There are at least half a million people currently caring for someone at the end of life. Carers are often an overlooked part of end of life care, who face difficulties in coping with complex needs and in coordinating care. In November 2012, the National Council for Palliative Care (NCPC), Carers Trust and partners held their first ever national conference focusing on the needs of carers of those approaching the end of life. This report explores five themes that emerged from the conference that carers have their own needs; are expert partners in care; need support in every setting; need to be acknowledged into bereavement; and that caring shouldn't be a fight. The report has been produced in partnership with Age UK, the Carers Trust, Carers UK, Help the Hospices, Macmillan Cancer Support, Marie Curie Cancer Care, and Sue Ryder. (RH)

Care at the end of life for people with dementia living in a care home: a qualitative study of staff experience and attitudes; by Gill Livingston, Catherine Pitfield, Jackie Morris ... (et al).

The present study aimed to examine barriers and facilitators to care home staff delivering improved end-of-life care for people with dementia. Individual qualitative interviews of 58 staff in a 120-bed nursing home where the staff and the residents' religion differed were carried out. Interviews continued until a maximum variation sample was achieved and theoretical saturation was reached. Study findings revealed that the staff felt warmly towards the residents and felt they could recognise when they were near death. However nurses and doctors did not see themselves as a team and communicated poorly with relatives about approaching death. The staff used opaque euphemisms and worried about being blamed. They were often unaware of or had concerns about the validity of advance care plans. They knew of the religious rituals around death but frequently misunderstood religious tradition. The authors conclude that staff require education and support about discussing and implementing plans around care at the end of life in dementia and about cultural issues around death to improve practice. This would enable the staff to implement advance care plans, knowing that they would be supported. Education would encompass communicating the complicated, unpredictable path of dementia near the time of death explicitly but sensitively, including recognition that people often do not hear difficult messages and are unable to take in large quantities of information at once. Staff need to know about the resident's religious and cultural ideas as well as ritual practice. (JL)

Decision-making in older adults with serious illness: barriers to the goals of care discussion; by Rangaraj K Gopalraj, Laura J Grooms, Belinda K Setters ... (et al).

Individualising the goals of care discussion is challenging, especially at the end of life. This article explores some difficulties with goals of care planning using a clinical scenario involving a cognitively impaired older African-American woman with advanced chronic lymphocytic leukaemia and dementia facing a life-threatening condition. Physicians should personalise divergent goals such as a cure, rehabilitation, life-prolonging care and comfort care after factoring in individual patient preferences and disease trajectories. This case illustrates the barriers to the goals of care discussion: lack of education about the disease progression, poor communication techniques, poor language choice, not having proper decision-makers present and lack of trust between the decision-maker and the healthcare team. Harnessing technology can cause breakthroughs in the future. (JL)

Palliative care patients who live alone report greater psychological distress, and are less likely to die at home than those living with a family carer. However, there is a lack of research on the value of models of care that specifically address this disadvantage. This article describes the experiences of terminally ill 'home alone' people using one of two models of care aimed at maintaining participants' need for independent living, focusing on the effect of these two models of care on their physical, social and emotional needs. 26 palliative care patients of Silver Chain Hospice Care, in Western Australia, were randomly assigned to either having a personal alarm or additional care-aide hours in their home. An in-depth qualitative study was conducted in two phases in 2010 using face-to-face interviews. The care-aide model of care resulted in benefits such as easing the burden of everyday living; supporting well-being; enhancing quality of life and preserving a sense of dignity; and reducing loneliness and isolation. The personal alarm model of care imparted a sense of security; provided peace of mind; and helped to deal with feelings of isolation. Participants in both groups felt that they could remain at home longer. By providing a safer, more secure environment through the use of a personal alarm or additional care-aide hours, patients were able to continue their activities of daily living, could build a sense of 'normality' into their lives, and they could live independently through support and dignity. Dying to know: [DVD]; by Helen Reading, National Council for Palliative Care - NCPC; Red TIE (theatre company); pFlix Films. London: pFlix Films, for the National Council for Palliative Care, 2012, 1 DVD (Dying Matters).

'Dying to know' is an intergenerational drama about the difficulties and benefits of talking about the end of life. It tells the story of a family trying to come to terms with the imminent death of a much-loved and close relative. The film is based on a play commissioned by the Earl Mountbatten Hospice on the Isle of Wight and written by Helen Reading, Director of the Isle of Wight Red TIE theatre company. The script was adapted by Dying Matters and pFlix Films to further promote the importance of end of life discussions. Dying Matters is a national coalition led by the National Council for Palliative Care (NCPC), which aims to ask such questions and to change public knowledge, attitudes and behaviours towards death, dying and bereavement (see www.dyingmatters.org). Guidelines for nursing homes delivering end-of-life care to residents across the island of Ireland; by Suzanne Cahill, Daphne Doran, Max Watson.: Emerald, March 2012, pp 60-70.

Quality in Ageing and Older Adults, vol 13, no 1, March 2012, pp 60-70.

This study was undertaken as part of the Living with Dementia programme based in the School of Social Work and Social Policy, Trinity College Dublin. It aimed to contribute to improving quality of life for people with end-stage dementia living in residential care settings, by investigating the experiences of aged spouses whose relatives died with end-stage dementia in nursing homes in both Northern Ireland (NI) and the Republic of Ireland (RoI). A second aim was to develop guidelines for nursing home staff for the delivery of quality care to residents with end-stage dementia in residential institutions. The study had two phases. Phase one involved conducting in-depth qualitative interviews with spouse caregivers whose relatives had died from dementia in long-stay care environments. Phase two entailed incorporating the information gathered through the in-depth interviews into draft guidelines and disseminating these to a multi-disciplinary group of health service professionals for their critical appraisal and ratification. The findings showed that most spouses deemed the end of life (EoL) care that was delivered to be of high quality, with person-centred, individual, kind, professional care being highly valued. Areas of dissatisfaction noted included poor communication, lack of involvement in key decision making, and poor symptoms control. Based on the study's findings, guidelines for the delivery of quality care in long stay residential institutions were developed in consultation with eight health service professionals. The authors hope these guidelines will contribute to improvements in the care of people with dementia at end of life, and will form the basis for the future development of policy, practices and procedures. The impact of the Marie Curie Nursing Service on place of death and hospital use at the end of life: research report; by Xavier Chitnis, Theo Georgiou, Adam Stevenson (et al), Nuffield Trust; Marie Curie Cancer Care. London: Nuffield Trust, November 2012, 62 pp (Evidence for better health care).

Although most people would prefer to die at home, more than half of all deaths in England and Wales are in hospital. The Marie Curie Nursing Service (MCNS) provides home-based end-of-life care to around 28,000 people at the end of life in the UK every year. Marie Curie Cancer Care commissioned the Nuffield Trust to evaluate the effect of its end of life home-based nursing service, by racking the experiences of more than 29,000 people who received care from MCNS, comparing their outcomes to a "control" group of end of life patients with similar circumstances who had not received care from Marie Curie. This report outlines the study's methods and results. It found that whereas 76.7% of those who received MCNS care died at home and only 7.7% died in hospital, 35% of the "controls" died at home and 41.6% died in hospital. The report also presents results concerning the effect of the MCNS on hospital use and the impact of the service on hospital costs. There is evidence that home-based nursing care can reduce hospital use at the end of life and help more people to die at home. In a difficult financial climate, there is a compelling case for service models other than hospital care in the last stages of life. This report is also available as a download (http://www.nuffieldtrust.org.uk/publications/marie-curie-nursing). (RH)

Managing multiple goals in family discourse about end-of-life health decisions; by Allison M Scott, John P Caughlin.

Research on Aging, vol 34, no 6, November 2012, pp 670-691.

Previous research on end-of-life communication in families has largely considered whether family members have talked about end-of-life healthcare (quantity of talk) but not whether certain characteristics of that discourse matter (quality of talk). In this study, the authors adopted a multiple goals theoretical perspective to examine discursive features that individuals use to manage goal dilemmas in family conversations about end-of-life health choices. Discourse analysis of end-of-life conversations between 121 older adults and their adult children showed that participants attended to relevant task, identity, and relational goals in ways that affirmed or threatened these goals, and the ways in which certain goals were accomplished had implications for how (and whether) other goals were pursued. Findings suggest that end-of-life talk in families is most effective when family members are able to address the task of discussing end-of-life decisions, while also attending to the relevant identity and relational implications of such conversations. Older people dying with dementia: a nationwide study; by Koen Meeussen, Lieve Van den Block, Michael Echteld (et al).

Large-scale nationwide data describing the end-of-life characteristics of older people with dementia are lacking. This paper describes the dying process and end-of-life care provided to older people with mild or severe dementia in Belgium, compared to older people dying without dementia. A nationwide retrospective mortality study was conducted, via a representative network of general practitioners (GPs) in 2008 in Belgium, with weekly registration of all deaths (aged 65+) using a standardised form. GPs reported on diagnosis and severity of dementia, aspects of end-of-life care and communication, and on the last week of life in terms of symptoms that caused distress as judged by the GP, and the patients' physical and cognitive abilities. 31% of the sample (1,108 deaths) had dementia (43% mildly, 57% severely). Of these, 26% died suddenly, 59% in care home, and 74% received palliative treatment, versus 37%, 19%, and 55% in people without dementia. GP-patient conversations were less frequent among those with (45%) than those without (73%) dementia, and 11% of both groups had a proxy decision-maker. During the last week of life, physical and psychological distress was common in both groups. Of older people with dementia, 83% were incapable of decision-making and 83% were bedridden, both significantly higher percentages than found in the group without dementia (24% and 52%). Several areas of end-of-life care provision could be improved. Early communication and exploration of wishes and appointment of proxy decision-makers are important components of an early palliative care approach which appears to be initiated too infrequently. Open to all?: Meeting the needs of lesbian, gay, bisexual and transgender people nearing the end of life: [DVD]; by National Council for Palliative Care - NCPC; Consortium of Lesbian, Gay, Bisexual and Transgendered
Preferences for end-of-life treatment: concordance between older adults with dementia or mild cognitive impairment and their spouses; by Liat Ayalon, Yaacov G Bachner, Tzvi Dwolatzky (et al).
There is considerable debate about the ability of proxies to adequately reflect patients' preferences regarding end-of-life care, when patients are no longer capable of stating their preferences. This Israeli study evaluated concordance in end-of-life preferences between patients with mild cognitive impairment (MCI) or dementia and their spouses. A cross-sectional sample of 106 respondents (53 couples) was recruited in two psychogeriatric clinics. Bivariate analyses were conducted to evaluate the degree of agreement between the patients' preferences and those of their spouses. Patients were more likely to opt for more treatment than their spouses. Moderate agreement between patients and spouses was evident for preferences regarding end-of-life decisions for the patients. There was little concordance between the wishes of spouses regarding their own preferences and what they wanted for the patient or what the patient wanted. When incorrectly predicting patients' preferences, spouses were more likely to ask for treatment. The results show that regarding end-of-life preferences for patients, there is moderate agreement between patients and their spouses, but limited evidence for projection of spouses' preferences on patients (i.e. the spouse making a prediction based on own wishes). Potential differences in end-of-life preferences between older adults with MCI or mild dementia and their caregivers should be taken into consideration in the preparation of advance care planning. The route to success in end of life care: achieving quality for lesbian, gay, bisexual and transgender people; by Bridget Moss, Tes Smith, Kathryn Almack, National End of Life Care Programme, NHS, Department of Health - DH; St Helena Hospice, Colchester; University of Nottingham. [London]: National End of Life Care Programme, 2012, 34 pp.
The Department of Health's End of Life Care Strategy (DH, 2008) emphasised the need to raise the quality of care provided to dying people and their loved ones. This practical implementation document aims to provide a guide for everyone working with lesbian, gay, bisexual and transgender (LGBT) people, and for LGBT people themselves, whether dying or receiving end of life care. It is intended to support practitioners and staff caring for LGBT people to engage with key professionals, and to ensure that those who may be in the last months of life receive high quality end-of-life care. The guide follows the six steps of the End of Life Care Pathway laid out in the national End of Life Care Strategy (2008), beginning with initiating discussions as end-of-life approaches and concluding with care after death. Each section outlines the relevant steps of the pathway, identifies issues to consider about the individual's care, and links to the practitioner and/or staff role in that care. The guide includes case studies highlighting best practice, and suggests further information resources. (RH)

Spirituality and end of life issues: a review; by Gillian A Reid.
This article explores theories related to the development of spirituality and its relationship to end of life circumstances. It also considers the source of spiritual well-being, and its place in the context of the third (older,
but still living independently) and fourth (frail elderly, needing care support) stages of life; plus how a sense of spirituality affects and hopefully enhances the end of life experience, increasing resilience to adverse events that might otherwise hasten death. It concludes that spiritual as well as religious issues are important for people facing terminal illness and death. (JL)

Advance care planning for people with dementia: a review; by Karen Harrison Dening, Louise Jones, Elizabeth L Sampson.
Few people with dementia have made advance plans for their health care. Advance care planning (ACP) is a process of discussion between an individual and their care providers that takes account of wishes and preferences for future care. The authors aimed to examine the facilitators and inhibitors to ACP in people with dementia. They also aimed to identify key themes in the literature and to critically review the methodologies used. They conducted a systematic search of English language databases including PubMed, CINAHL, AMED, PsychINFO, EMBASE and BNI. They included empirical studies which reported the characteristics of the patient population, the type of advance care planning used and the study setting, and which involved people with dementia, family members or professional carers. 17 studies were identified (11 quantitative methods, one qualitative and five mixed methods). One ACP intervention which changed outcomes for people with dementia was found. Four key themes were identified. First, there is a point at which cognition decreases critically so that an advanced care plan can no longer be made. Second, factors present in family carers and professionals can influence decision-making and the ACP process. Third, ACPs are affected by preferences for life sustaining treatments; ACP in dementia may differ from other illness groups. Lastly, there is a need for education relating to ACP. The current evidence base for ACP in dementia is limited. Since UK government policy recommends that all people should engage in ACP, more evidence is needed to understand the feasibility and acceptability of advanced care plans for people with dementia. (RH)

Barriers to providing palliative care for older people in acute hospitals; by Clare Gardiner, Mark Cobb, Merryn Gott, Christine Ingleton.
The study aimed to explore the perspectives of health professionals regarding barriers to optimal palliative care for older people in acute hospitals. 58 health professionals participated in eight focus groups and four semi-structured interviews. Participants identified various barriers to palliative care provision for older people, including attitudinal differences to the care of older people, a focus on curative treatments within hospitals and a lack of resources. Participants also reported differing understandings of whose responsibility it was to provide palliative care for older people, and uncertainly over the roles of specialist and generalist palliative care providers in acute hospitals. Concludes that additional research is required to further explore age-related issues contributing to poor access to palliative care. (JL)

Difficult conversations: making it easier to talk to people with dementia about the end of life; by National Council for Palliative Care - NCPC; National End of Life Care Programme, NHS, Department of Health - DH.
This guidance aims to help carers and professionals caring for someone with dementia to open up conversations about end of life wishes and preferences. It is based on conversations with around fifty people affected by dementia, people with dementia, carers and former carers. The booklet also suggests other useful resources, and is part of a range of materials published as part of NCPC's role as lead organisation of the Dying Matters Coalition, which aims to raise awareness of dying, death and bereavement. 'Doubly deprived': a post-death qualitative study of primary carers of people who died in Western Australia; by Sharon Keesing, Lorna Rosenvax, Beverley McNamara. Health and Social Care in the Community, vol 19, no 6, November 2011, pp 636-644. This study explored the daily experiences and occupational needs of family carers providing palliative care to people who were dying. In particular it examined their daily routines and ability to undertake other varied activities, and whether their needs were addressed in the community using available services. A purposive sampling method was used to identify ten people who had cared for a family member who had died in the preceding two years. Semi-structured interviews included questions about their experiences as a carer including routines, engagement in usual activities and the impact of the caring role on their daily life during and after the period of care. Two important themes were identified: the carers experienced disengagement and deprivation from their usual occupations during and after the period of care. They also described significant disempowerment in their role as carer. The findings show that carers are ‘doubly disadvantaged’: they are unable to participate in their usual occupations, and they are not recognised for their contributions as carers. In addition, the current services and support available for carers in the community are deemed inadequate. (JL) ISSN: 09660410 From: http://www.ingentaconnect.com/content/bsc/hssc Dying out-of-hours: 24/7 care at the end of life: conference report: a joint conference hosted by the National Council for Palliative Care and Macmillan Cancer Support, 3 march 2011; by National Council for Palliative Care - NCPC; Macmillan Cancer Support. London: National Council for Palliative Care, 2011, 12 pp. There is wide acceptance that high-quality care can make a large difference for patients nearing the end of life, and to their families, carers and friends. Round the clock care (now referred to as 24/7) was recognised in the 2008 End of Life Care Strategy for England as a cornerstone of palliative and end-of-life care best practice. This report summarises the main points from the ‘Dying out-of-hours: 24/7 care at the end of life’ conference, including examples of good practice. (RH) From: National Council for Palliative Care, The Fitzpatrick Building, 188-194 York Way, London N7 9AS. E-mail: enquiries@ncpc.org.uk Website: www.ncpc.org.uk End-of-life care in elderly cancer patients; by Sophie Pautex, Gilbert B Zulian. Aging Health, vol 7, no 3, June 2011, pp 469-475. In spite of increased life expectancy at the dawn of the 21st century, chronic disorders in older people are still taking their toll, with cancers being the most prevalent. The question of how to approach the end of life remains largely unresolved, however the development of palliative care may provide some answers. Although the deficits in providing good palliative care are well known in many areas, dramatic improvements have been made to allow healthcare professionals to achieve impeccable symptom control, through sedation, chemotherapy and other means. However, patients' existential suffering remains, and many are likely to become cognitively impaired. The use of advance directives may be appropriate in order to ensure patients' autonomy as they become incapable of making their own decisions. However the practice of assisted suicide and euthanasia (which are considered acceptable in some countries) are of great professional and ethical concern. Education, training and research are key elements for the development of palliative care and for the general improvement of care delivered to older patients approaching the end of their lives. (JL) ISSN: 1745509X From: http://www.futuremedicine.com/loi/ahe End-of-life care: Japan and the world: international comparison study on death and dying in place: abbreviated version; by International Comparative Study on Ideal Terminal Care and Death; International Comparative Study on Terminal Care System; International Longevity Center, Japan - ILC-Japan. Tokyo: International Longevity Center, Japan - ILC-Japan, March 2011, 48 pp. The research summarised in this report aims to clarify differences in end-of-life care between Japan and seven other countries (France, UK, Israel, Australia, the Netherlands, South Korea and the Czech Republic). It looks at special features of such care, including ethical issues. An anticipatory decision document records a person’s wishes regarding medical treatment at a time when they have capacity to make choices, to be enacted when that capacity is lost. In England and Wales an advance decision to refuse treatment (ADRT), a legally binding document, is currently rarely used. A disparity is suggested to exist between physicians' support for anticipatory decisions in principle and their lack of impact on decision-making in practice. The aim of the present study was to elicit geriatricians' views on advance decisions and their use in decision-making in England. Study findings showed that geriatricians held positive views on anticipatory decisions in principle. In practice, they reported being highly likely to follow a decision which was in line with their clinical view. They would also favour an ADRT which was prescriptive in terms of the situation and treatment to which it applied. However, geriatricians expressed concerns in relation to patient understanding of the role and limits of these documents. Participants expressed discomfort in following an ADRT which, in their professional opinion, did not represent the patient's best interests, despite it being a legally binding document. A conflict between doctors' beneficence and patients' autonomy was apparent, with geriatricians differing in their views on how ADRTs should fit into medical decision-making, and particularly how far anticipatory decisions can represent ongoing patient autonomy. Despite its status in law, an ADRT which conflicts with a geriatrician's clinical opinion may not be implemented, resulting in a breach of the Mental Capacity Act. (JL)

Improving end-of-life care for people with dementia; by Elizabeth L Sampson, Alistair Burns, Mike Richards.
One in three adults over the age of 60 years will die with dementia. Most will have complex physical and psychological needs. This paper looks at why people with dementia experience poor end-of-life care, what are the end-of-life care needs of people with dementia and their families, and how such care for this client group can be improved. The authors refer to recent government strategies aimed at improving services, eg. The National Dementia Strategy, and the National End of Life Care Strategy. However the research has tended to focus on people with advanced dementia and little is known about people in the earlier stages of dementia who may be dying from other chronic comorbid conditions. New interventions on service models to improve care will have to be developed carefully, taking into account the wide range of settings in which people with dementia die. (JL)

Living through end-stage dementia: the experiences and expressed needs of family carers; by Chris Shanley, Cherry Russell, Heather Middleton, Virginia Simpson-Young.
The study focused on the experiences and needs of family carers of people with end-stage dementia. The project involved in-depth, qualitative interviews with 15 carers. The major themes emerging from the accounts of participants' experiences were: getting support; having to trust others with care; managing the loneliness of being a carer; witnessing a loved one fade away; anticipating and experiencing death; and re-establishing life after the funeral. Carers expressed a range of instrumental and psychosocial needs. The study provided a more personal account of the caring experience than much of the related literature. It emphasised the need of carers for genuine understanding and connection - from family and friends as well as healthcare staff. The study highlights the amount of support carers can provide to each other through support groups and associated friendships, and stresses the importance of healthcare staff acknowledging and respecting this capacity of carers. The authors report on the benefits of a nurse facilitating good end of life care for people with dementia in the community, including those in care homes. The modernisation initiative End of Life Care Programme, 2008-2011, aims to improve end of life care for people with dementia in Lambeth and Southwark, London. The Nurse Facilitator for End of Life Care role was created to encourage and support best practice, to combine end of life care with dementia care skills, and to enhance the skills of care staff. The facilitator worked closely alongside nurses and care staff in several ways, through observation, carrying out pain assessments and sharing tasks.

Older people with heart failure and general practitioners: temporal reference frameworks and implications for practice; by Susan Waterworth, Merryn Gott, Deborah Raphael, Sarah Barnes.
Health and Social Care in the Community, vol 19, no 4, July 2011, pp 412-419.
Chronic illness changes one's sense of time, and chronic disease management and palliative care have implications for health professionals' use of time. The aim of the study was to identify the temporal reference frameworks that structure and give meaning to the experiences of time for older patients with heart failure and their general practitioners (GPs). Secondary analysis of qualitative data collected from two longitudinal studies, one in the United Kingdom and the other in New Zealand, was carried out. The UK study involved interviews with 44 older people with heart failure and nine focus group discussions with primary health professionals during 2004-2005. The NZ study involved 79 interviews with 25 older people with heart failure and 30 telephone interviews with GPs during 2008-2009. Different temporal reference frameworks were identified for both patients and GPs. 'Clock time' was evident in how it structured the consultations. Both patients and GPs valued 'needing time', however there were tensions between 'needing time' and 'wasting time'. For some GPs this involved creating space for 'emotional time'. Being 'known over time' was important to both patients and GPs. The article concludes that understanding these multiple times is important for improving the quality of care for older people. (JL)

Open to all?: Meeting the needs of lesbian, gay, bisexual and trans people nearing the end of life; by Alice Fuller, Sam Turner, Mark Delacour, National Council for Palliative Care - NCPC; Consortium of Lesbian, Gay, Bisexual and Transgendered Voluntary and Community Organisations. London: National Council for Palliative Care, 2011, 27 pp.
The National Council for Palliative Care (NCPC) and the Consortium of Lesbian, Gay, Bisexual and Transgendered Voluntary and Community Organisations set out to gauge experiences and current practices from both sides: LGBT people who have or will need to use palliative care services and services providing end of life care in the community. This document presents the findings of a short survey conducted in 2010 regarding what further work was needed. 739 responses were received, and the focus is on answers to the open-ended questions on matters such as treating people equally, and tackling homophobic or transphobic attitudes. The report concludes that end of life service providers need to do all they can to make their services truly open to all, and to promote themselves to the lesbian, gay, bisexual and transgender (LGBT) communities in their local areas. Palliative and end-of-life care in psychogeriatric patients; by Abhilash K Desai, George T Grossberg.
An increasing number of older adults and their families are burdened by one or more terminal illnesses in the later years of their lives. How best to support their quality of life is a major challenge for healthcare teams. Palliative and end-of-life (PEOL) care is well positioned to respond to this challenge. While the evidence of PEOL is just beginning, much of the suffering can be relieved by what is already known. PEOL care for older adults needs to go beyond the focus on the patient and should rest on a broad understanding of the nature of suffering that includes family and professional caregivers. The dissemination of PEOL care principles should be a public health priority. This article aims to improve understanding of appropriate PEOL care and discuss future perspectives. (JL)
In this paper the authors present data from research on couples where one partner died, drawing on a study of the financial implications of a partner's death. Information was gathered from a study based on the British Household Panel Survey of over 750 couples separated by death, and from interviews with 44 recently bereaved women and men from all age groups. The article describes the findings on adopting an identity of caregiving, people's characteristics and circumstances, health care needs, service contacts, and trends over time, and discusses models showing a range of factors and their success in predicting whether people described themselves as providing care. The study findings showed that carer self-identification was influenced by the partner's health care needs and service contacts, including receipt of welfare benefits. The authors conclude that further research is required to investigate the circumstances under which providing care equates with adopting or assigning a carer identity. (JL)

Pharmacotherapy at the end-of-life; by Denis O'Mahony, Marie N O'Connor. Age and Ageing, vol 40, no 4, July 2011, pp 419-422.
Older people reaching the end of life are particularly at risk from the harmful effects of inappropriate drug use. These drugs may also be highly expensive. End-of-life pharmacotherapy is sometimes perceived to be complex and challenging, probably unnecessarily. This relates in part to the poorly developed evidence base and lack of high-quality research in this area. In this article the authors examine some of the key issues relating to pharmacotherapy in end-of-life patients, namely (i) the guiding principles of drug selection, (ii) the main drugs and drug classes that are best avoided, (iii) the benefits of 'oligopharmacy' (i.e. deliberate avoidance of polypharmacy) in end-of-life patients. (JL)

The authors share learning from Facing the Future, a project which involved meeting with relatives’ groups to talk about end of life issues. Based in south London, the project is a peer support service for carers of people with dementia. It focuses on providing support for carers of people with dementia facing end of life care dilemmas, in the context of objectives in the National Dementia Strategy and the End of Life Care Strategy. The project recruited volunteers who had cared for someone with dementia who had died at least a year before to become peer supporters, who asked care homes about speaking at their regular relatives meetings to introduce the volunteers and generate discussion. The article discusses issues arising from the meetings, including the support needs of the volunteer carers and relatives, and the importance of involving staff. (RH)

Third of four articles that together make up a special issue on research methodology and ageing. This article looks at how increased life expectancy coupled with the rise in chronic disease has had a significant impact on dying trajectories in old age. This poses ethical and methodological challenges for researchers, not least because it is often difficult to establish whether an older person is dying from, as opposed to living with, one or more diseases. This article reports a comprehensive literature review of empirical research on the end-of-life in old age. It presents two inter-related themes by first exploring the social and cultural contexts of death and then critically analysing the methods and ethical approaches adopted by researchers. Material was drawn from both cross-cultural studies and studies in which cultural factors were of prime interest, and were selected with a view to investigating the concept of a good death in old age. First, the article examines the evidence of cultural similarities and differences and the impact of social and cultural change on ideas concerning a good death. It then identifies contemporary influences and pressures on end-of-life care for older people. Finally, the article explores the significance of communication and the roles of families and service providers in this arena. (JL)
We are living well but dying matters; [DVD]; by National Council for Palliative Care - NCPC; National End of Life Care Programme; CHANGE. [Leeds]: CHANGE, 2011, 1 DVD (Dying Matters).

People with learning disabilities need to be able to acknowledge their loss and to mourn when someone close to them dies. They also need to be included in important decisions being made around their end of life care (especially their own), to be able to ask questions, and to have their emotional needs met and dying wishes recorded. This DVD was funded by the National Council for Palliative Care (NCPC) and the National End of Life Care Programme. In the DVD, people with learning disabilities tell their stories and share their wishes to support other people with learning disabilities to become more comfortable talking about dying, death and bereavement. 2010

Journal of Dementia Care, vol 18, no 1, Jan/Feb 2010, pp 36-39 (Research focus).

Care homes play a major role in supporting people with dementia at the end of their lives. In seeking to understand the views of staff on the care they provide, the authors held focus groups with a range of staff in nine care homes in the West Midlands. Staff discussed issues such as where death should take place, how they planned end-of-life care, and how they coped with death. This article outlines findings on admission to hospital at end of life, liaison with relatives, and advance statements. The implications for practice of these findings are discussed. (RH)

Milford Care Centre is a major centre for specialist palliative and gerontological care in the Mid-West of Ireland. In August 2008, a Librarian was employed to support the information, research, teaching and professional development needs of staff and students. In planning associated with this role, it was necessary to undertake an analysis of the information needs of staff. The objectives: (1) To understand the information needs of staff with regard to the new Library and Information Service. (2) To identify current access to and levels of skill in information literacy and ICT. (3) To ascertain the need for training in those skills. A web-based questionnaire was disseminated by email and printed copies were left at other locations. Assistance with obtaining journal articles was rated most highly by respondents as being an important service. Eighty-three per cent indicated that they did not have access to online health databases. Small group classes were considered the preferred method of providing training. Afternoons were also considered more convenient for visiting the library. The results will be used to plan the development of the library with a better insight of users needs and assist us to utilise resources more effectively. (KJ)

End-of-Life decisions are not only about palliation and advanced directives. The biopsychosocial model is a paradigm which helps identify the psychological and social factors and barriers which help towards a realistic balance towards the end of life. Spirituality in particular, is not merely religious practices and the presence of pastoral care, but is about achieving balance, harmony and meaning. New models can help for older people in extending the concept of palliative care at the very end of terminal diseases to more chronic and disabling conditions which affect the outcome. Moreover, one should not consider end-of-life decision based merely on age, but in the case of the elderly palliation and other biopsychosocial decisions which would otherwise be directed only in terminal illness, need to be considered earlier. Can you see me?: an Amanda Waring film for the National Council for Palliative Care: [DVD]; by Amanda Waring, National Council for Palliative Care - NCPC. London: National Council for Palliative Care, 2010, 1 DVD + leaflet.

This film aims to inspire and encourage providers and commissioners of end of life care to consider everyone in their community, particularly those who are often invisible, including those who are homeless, from black minority ethnic communities, and who have conditions other than cancer. It describes end of life care needs, how to respond, and ways to ask people what they want. The film could be used in training, for discussion around questions such as: Who is in your community? Are you meeting their needs? Have you asked them what they want? The leaflet also refers to Dying Matters, a national coalition led by the National Council for Palliative Care, which aims to ask such questions and to change public knowledge, attitudes and behaviours towards death, dying and bereavement (see www.dyingmatters.org). Challenges to improving end of life care of people with advanced dementia in the UK; by Ingela C V Thuné-Boyle, Elizabeth L Sampson, Louise Jones (et al).

The end of life care received by patients with advanced dementia and their carers is of increasing importance as the incidence of dementia is set to rise in the next 30 years. Currently, inappropriate admissions to hospital are common in the UK and patients are less likely to be referred to palliative care services, receive less pain control, but undergo more invasive interventions compared to their cognitively intact counterparts. Patients and families are seldom informed of the terminal nature of dementia and advance care planning discussions are rare. The aim of this study was to improve the understanding of end of life care needs for this patient group and their carers, and to use this information to devise an intervention to improve care. Qualitative data were obtained from relatives of 20 patients with advanced dementia admitted to an inner London teaching hospital acute National Health Service (NHS) Trust and 21 health care professionals involved in their care. Framework analysis was used to analyse the transcripts. The results showed that participants’ understanding of dementia and its likely progress was poor. Provision of information regarding the future was rare despite high information needs. Attitudes regarding end of life care were often driven by the participant's illness awareness. These attitudes served to guide the decision making process and appear to be a major barrier to the provision of more
appropriate care. Implications for patient care are discussed and suggestions for future interventions are made. (KJ/RH)

Deaths in older adults in England; by Kate Ruth, Julia Verne, National End of Life Care Intelligence Network - NEoLCIN, NHS End of Life Programme, Department of Health - DH; South West Public Health Observatory - SWPHO. London: National End of Life Care Intelligence Network, October 2010, 68 pp.

The South West Public Health Observatory (SWPHO) has been commissioned to produce key outputs and analyses for the National End of Life Care Intelligence Network (NEoLCIN), including the national End of Life Care Profiles, available on the Network's website (www.endoflifecare-intelligence.org.uk). This is the fourth report published by the Network, and looks at deaths of people aged 75+ to examine differences in place and underlying cause of death by age band from old to extreme old age. It finds that there appears to be a trend in all age groups for the proportion of deaths in hospital to have increased in the period 1995 to 2008; this has since levelled off. The report also examines deaths by socio-economic status. While more deaths in people aged 75+ occurred amongst people living in more deprived areas, the proportion of deaths in people aged 75+ in the most deprived areas decreased with increasing age. (RH)

The differences between general care planning and decisions made in advance; by Sheila Joseph, National End of Life Care Programme, NHS, Department of Health - DH. [Leicester]: National End of Life Care Programme, 2010, 4 pp.

Advance care planning (ACP) is a process of discussion between an individual patient and care providers irrespective of discipline. The difference between ACP and planning more generally is that the process of ACP is to make clear a person's wishes, and will usually take place in the context of an anticipated deterioration of the individual's condition in the future, with attendant loss of capacity make decisions and/or ability to communicate wishes with others. This pamphlet clarifies the differences between general care planning and three decisions that can be made in advance: advance care planning (ACP, or advance statement), advance decisions to refuse treatment (ADRT), and do not attempt cardiopulmonary resuscitation (DNACPR). Websites for further information are suggested. (RH)

Due respect and professional care in death; by David Jolley, Mike Tapley. The Psychiatrist, vol 34, issue 4, April 2010, pp 143-145. The Royal College of Physicians' Palliative Care Services: Meeting the Needs of Patients and the Department of Health's End of Life Care Strategy are important reports that signify a national and international determination to address the needs of people who are nearing their time of dying, and their families, with positive, well-informed professionalism. Despite the advances of medicine and improved social conditions, death will eventually supervene. Psychiatrists and other mental health workers encounter death, in anticipation of its coming and in its aftermath. They need to be aware of developments in the field of end-of-life care and contribute to developments which are occurring, as well as learn and assimilate better practices. (KJ/RH) ISSN: 17583209 From: http://pb.rcpsych.org doi: 10.1192/pb.bp.109.026260

The dying art: [Social worker involvement with end-of-life care]; by Sally Gillen. Professional Social Work, September 2010, pp 20-21. This article highlights a report's findings published in 2010, that social workers are not sufficiently engaged in working with people, especially older people, who are near the end of their life; and saw in fact, that end of life care was not their responsibility. This situation should be improved with further training, especially from existing sources, such as that from the hospice movement. The featured report is published by the National End of Life Care Programme, entitled "Supporting People to Live and Die Well" and can be found on their website to download(www.endoflifecareforadults.nhs.uk/publications). ISSN: 13523112 From: http://www.basw.co.uk

Dying for a change; by Charles Leadbeater, Jake Garber, Demos. London: Demos, 2010, 136 pp. The institutionalised ways we cope with dying do not align with how most people aspire to die. Most people want to die with family and friends nearby, cared for, free from pain, with medical support available when needed. Yet most people will die in hospitals and care homes, often cut off from friends and family, dependent on systems and procedures that feel impersonal, over which they have little control and which too often offer them little dignity. The UK government spend large sums of taxpayer's money - at least £20 billion a year - on services that leave too many people feeling confused, frustrated and distressed too much of the time. The country should be able to provide people with better ways to die. This paper argues for improvements to existing services: making end of life advance care plans the norm; training more in the medical profession in palliative care; and more greatly integrating the care services provided by the public, private and voluntary sectors. It also suggests radical innovations: a new infrastructure of home hospices, the creation of a compassionate care benefit and a properly trained volunteer support network providing palliative care - a perfect opportunity for the Big Society. The challenge is to help people to achieve what is most important to them at the end of life. Dying for Change describes how that challenge can be overcome. (KJ) Price: £10.00 or download From: http://www.demos.co.uk

Dying Matters Newsletter; by Dying Matters Coalition. London: National Council for Palliative Care - NCPC, March 2010, newsletter + 5 A5 pamphlets. The Dying Matters Coalition is raising public awareness of dying, death and bereavement in England; it is led by the National Council for Palliative Care (NCPC). This particular issue of the newsletter was published during the first Dying Matters Awareness Week 15-21 March 2010, which saw events and activities taking place nationwide. A series of five pamphlets and a poster was also launched during the week which are designed to help people focus on talking about death and dying, especially during times of terminal illness or bereavement. (KJ/RH) From: Dying Matters Coalition, The Fitzpatrick Building, 188-194 York Way, London N7 9AS. www.dyingmatters.org

End of life care: a rapid response hospice at home service; by Carol Davis. Nursing Older People, vol 22, no 4, May 2010, pp 22-24. Many people would prefer to die at home. In line with recommendations on this in the Department of Health (DH) End of life care strategy (2008), the charity Sue Ryder Care piloted a rapid response care and palliative expertise at home initiative in Bedford. The project supported 17 patients to die in their own homes. Evaluation of the project will be shared with the local primary care trust (PCT) in the hope that it will continue to fund the service. Other community-based models of end of life care that the charity has developed are outlined. The author discusses the benefits of the scheme and feedback from the 17 families it helped. (RH)
End of life care for community dwelling older people with dementia: an integrated review; by Claire Goodman, Catherine Evans, Jane Wilcock (et al).
An integrated review synthesised the qualitative and quantitative evidence on end of life care for community dwelling older people with dementia. English language studies that focused on prognostic indicators for end of life care assessment, support and/or relief, respite and educational interventions for community-dwelling older people with dementia were included. A user representative group informed decisions and the breadth of literature used. Each study selected was screened independently by two reviewers using a standardised checklist. 68 papers were included. Only 17% (12) exclusively concerned living and dying with dementia at home. 6 studies included direct evidence from people with dementia. The studies grouped into four broad categories: dementia care towards the end of life; palliative symptom management for people with dementia; predicting the approach of death for people with dementia; and decision-making. Most of the studies were descriptive. The few studies that developed dementia-specific tools to guide end of life care and outcome measures specific to improve comfort and communication demonstrated what could be achieved, and how much more needs to be done. Research on end of life care for people with dementia has yet to develop interventions that address the particular challenges that dying with dementia poses. There is a need for investigation of interventions and outcome measures for providing end of life care in the settings where the majority of this population live and die. (RH)

Exceptional care at the end of life; by Lynne Greenwood.
The 2008 end of life care strategy allocated £286m to primary care trusts (PCTs). This article looks at some of the innovations and improvements that are being made with this money. Examples range from a tool to manage the care of patients with uncertain prognosis, to facilities for newly bereaved relatives and carers. An example of the former is a form of personalised care called AMBER (assessment, management, best practice, engagement for recovery). Funded by Guys' and St Thomas' Charity, AMBER has been developed in partnership with clinical specialists and patient and carer groups. An example of the latter is a new bereavement suite at Southend University Hospital Foundation Trust, which incorporates provision of a registrar on site to prevent relatives having to make a separate visit to register a death. (RH)

The experiences of older adults in the community dying from cancer and non-cancer causes: a national survey of bereaved relatives; by Jenni Burt, Cathy Shipman, Alison Richardson (et al).
There is limited understanding of symptoms and care in the last two months of life for adults dying from causes other than cancer. This study employed a retrospective cross-sectional survey of bereaved relatives. The survey took place across eight cancer networks in England. A random sample of 1,266 adults who registered a death occurring in someone aged 65 and over between August 2002 and February 2004 was drawn. VOICES (Views of Informal Carers - Evaluation of Services) questionnaires were sent to sampled informants by the Office for National Statistics (ONS) 3-9 months after the registration of the death. Differences in the reported experiences of cancer and non-cancer decedents in symptoms, treatment and care were assessed using Pearson's chi square test. Cancer decedents were significantly more likely than non-cancer decedents to have had pain (93% vs 79%, P < 0.001), nausea and vomiting (62% vs 40%, P < 0.001) and constipation (74% vs 66%, P = 0.03), whilst a greater proportion of non-cancer decedents experienced breathlessness (74% vs 65%, P = 0.006). Across both groups, less than half of the decedents were reported to have received treatment which completely relieved their symptoms some or all of the time. There were significant variations in the receipt of district nursing, general practitioner care and other health and social care and the reported quality of this care, for decedents dying of cancer and non-cancer causes. Further, informants for cancer deaths reported greater satisfaction with support received. There are important differences in the reported experiences of older adults dying from cancer and non-cancer causes in the last months of life, independent of age. (KJ/RH)

The experiences of older adults in the community dying from cancer and non-cancer causes: a national survey of bereaved relatives; by Jenni Burt, Cathy Shipman, Alison Richardson (et al).
There is limited understanding of symptoms and care in the last two months of life for adults dying from causes other than cancer. This study employed a retrospective cross-sectional survey of bereaved relatives. The survey took place across eight cancer networks in England. A random sample of 1,266 adults who registered a death occurring in someone aged 65 and over between August 2002 and February 2004 was drawn. VOICES (Views of Informal Carers - Evaluation of Services) questionnaires were sent to sampled informants by the Office for National Statistics (ONS) 3-9 months after the registration of the death. Following the money: findings from NPCC’s survey to monitor the first year of investment in end of life care 2009/10; by National Council for Palliative Care - NCPC. London: National Council for Palliative Care, March 2010. 4 pp (Briefing 18).

In its election manifesto in 2005, the Government pledged to double the investment in palliative care. As a result, the Department of Health (DH) launched its first national End of Life Care Strategy for adults in England in 2008, with commitments being made to increase expenditure. The National Council for Palliative Care (NCPC) has received anecdotal reports that additional funds allocated to primary care trusts (PCTs) have not reached front-line services. This briefing outlines findings from a survey to ascertain whether strategic health authorities (SHAs), PCT commissioners and palliative care providers could account for the spending of these funds. 33 PCTs (35%) were unable to identify a specific amount as their initial budget for end of life care in 2009/10; more optimistically, other PCTs had a clearer understanding of what was included in their end of life care budgets; and two PCTs report on the areas of care included. Recommendations are made regarding greater transparency by PCTs and SHAs in using end of life care expenditure. (RH)

Guidance from the General Medical Council (GMC) on end of life care comes into force on 1 July 2010. Change became essential because of the Mental Capacity Act 2005 and after reviews reported how patients with terminal illness are denied informed choice. This article notes some of the changes, the main one being that death should become an explicit discussion point when patients are likely die within 12 months. Other changes include the replacement of “artificial” with “clinically assisted” in relation to nutrition and hydration; and “best interests” with “overall benefit”. The article notes subjects likely to provoke professional debate: decisions about cardiopulmonary resuscitation (CPR); resolving of clinical disagreements; administration of analgesia and sedatives at the end of life; and whether the guidance only applies to specialties managing progressive incurable diseases. The guidance is an important opportunity for the medical profession to re-establish public confidence that made this guidance necessary. The guidance, ‘Treatment and care towards the end of life: good practice in decision making’ can be found on the GMC website (at http://www.gmc-uk.org/guidance/ethical_guidance/6858.asp). (RH)

This article describes an interdisciplinary, inter-university course that prepares social work, nursing and chaplaincy students for competent practice when working with individuals and families facing end-of-life circumstances. Built upon a teaching format that provides knowledge-to-skill-building opportunities, the course immerses students in a range of related content. To maximize integration, the course relies on interdisciplinary team teaching (building knowledge) followed by practice sessions (building skill), in which volunteer actors play the roles of care recipients. With year 3 completed, course administrators have important indicators of the course’s effectiveness in offering content specific to end-of-life care using a combination of discipline-specific and interdisciplinary learning strategies. This process has provided valuable lessons related to the nature of interdisciplinary education in end-of-life care. (RH)

It's not just about heart failure; voices of older people in transition to dependence and death; by Susan Waterworth, Diane Jorgensen.
Health and Social Care in the Community, vol 18, no 2, March 2010, pp 199-207.
New Zealand's ageing population is predicted to increase from 12% in 2001 to 25% by the year 2051, similar to the worldwide trend of ageing. A high proportion of these people will have one or more chronic illnesses. Associated with the increase in survival is a growing body of research examining the needs of the older person with heart failure and finding particular problems with end of life care. Older people face many challenges in living with their heart failure, in particular the transition to dependence. This paper explores the experiences of older people living with heart failure and their transitions from independence to dependence, and for some, death. To study the transition, a longitudinal qualitative study using General Inductive approach was used. Participants were interviewed every 3 months for a 12-month period during 2006-2008. A total of 79 interviews with 25 people were completed. The findings showed that transition was not a simple linear process with the older person moving from one phase to another; instead their experiences illustrated the complexity of transitions they faced and what helped them to manage these. The older people in this study illustrated the importance of trust in health professionals, and believed they would receive good care. Their fears revealed concerns about being a burden as they deteriorate and becoming more dependent. Understanding the complex issues related to transition to dependence can provide health professionals with a framework for assessment and approaches to providing the support required. (KJ/RH)

The last year of life in Europe: regional variations in functional status and sources of support; by Karsten Hank, Hendrik Jurges.
Ageing and Society, vol 30, part 6, August 2010, pp 1041-1054.
This article aims to provide an initial account of the life circumstances of older people in 11 continental European countries during the year prior to their deaths. It focuses on regional variations in functional limitations and sources of support. The authors use logistic regression to analyse data from 523 end-of-life interviews in 2006-07, collected by the Survey of Health, Ageing and Retirement in Europe (Wave 2) about the respondents who had died since the baseline data collection in 2004-05. The prevalence of functional limitations was found to be fairly consistent across Northern, Central and Southern Europe. Significant regional differences existed, however, with regard to the deceased respondents' main sources of support and the locations of their deaths. Northern Europeans were the least likely to receive help from their family only and the most likely to be supported by non-kin. They also exhibited the highest risk of dying in a nursing home. In Mediterranean countries, a pattern of exclusive family support and dying at home prevailed. The findings support the notion of a "mixed responsibility" of families and welfare states as providers of support for older people in the last year of life. (RH)

The long term care of older people around the world is largely in the hands of people with low levels of education and small amounts of training. Even nurses working in nursing homes often lack specific training. This paper presents the development, implementation and evaluation of a short training package on end of life care, delivered to staff of 106 residential / social care and nursing homes run by the largest not-for-profit provider in the UK. It, and a subsequent national study, show how strong the "embedded values" of enhanced personal care, skills in the relief of suffering and attention to the need for empathic human presence are played out. The findings also provide detailed evidence of support and facilities for relatives as they seek to spend time in the last days and hours. It is concluded that enhancing and validating the positive values and practices with short training is more desirable than turning end of life care into a specialist field of work with its own credentials. Junior doctors play an important role in verifying sudden deaths in hospital and communicating with the family of the deceased. This article includes some case scenarios illustrative of how best to manage a sudden death; the circumstances in which a death should be referred to the coroner; and the questions to be considered in
completing a medical certificate of cause of death. The authors comment that while the Liverpool care pathway generally provides a framework for managing end of life care, it cannot be used fully for unexpected hospital deaths. The broader point of this article is that junior doctors have reported insufficient training in how to break bad news; and that even more experienced clinicians are not always confident in their ability to inform families of a sudden death. This article covers England and Wales; the situation in Northern Ireland differs in some respects. (RH)

The 'End of life care strategy' (Department of Health 2008) confirmed that provision for the spiritual needs of the dying required further work to develop practice. This National Council for Palliative Care (NCPC) report explores the key themes highlighted at "The Missing Piece" conference held in March 2010. It defines five different context within which spirituality can be expressed - religious, self-spirituality, aesthetic, secular, and therapeutic - as well as as there being different dimensions of spiritual need. It discusses spiritual support in different settings, and suggests that staff training and development is a priority. The document is also intended to promote discussion on the subject, on which examples of good practice are sought. Appendices include the competencies from the NICE guidance, 'Spiritual and religious care competencies for specialist palliative care', and draft quality markers for spiritual support, on which the Department of of Health (DH) is to consult in Autumn 2010. The Minimum Data Set (MDS) was developed in 1995 by the National Council for Hospice and Specialist Palliative Care Services (now the NCPC) in association with the Hospice Service at St Christopher's Hospice, London. The aim of the MDS is to provide good quality, comprehensive data about hospice and specialist palliative care services, in order to inform service management, development, commissioning and planning. This report provides a national overview of services in England, Northern Ireland and Wales; data on inpatients and outpatients, including their ethnicity as well as diagnoses; and data on day care, community services, hospital support, and bereavement support. The data are variously presented as tables or charts, accompanied by annotations. The findings are based on an overall response rate of 66% (328 services) to a questionnaire sent to all services providing palliative care in England, Northern Ireland and Wales. (RH)

Notes on the end of life: the social interactions between patients, carers and professionals; by Daniel Briggs. Quality in Ageing and Older Adults, vol 11, issue 2, June 2010, pp 35-46.
How people die and experience the road to death is important for all concerned: the patient who is dying, the family carers and loved ones they leave behind, and the health and social care practitioners. However, family carers often make great emotional and financial sacrifices and also assume heavy administrative roles to support the care of their loved one. This paper reports on the social interactions between patients, carers and professionals during end of life (EOL) care. The findings are based on a primary care trust (PCT) funded consultation that examined the quality of EOL care services in one London borough. The project made great use of ethnographic methods (open-ended qualitative interviews and observations) with 50 borough residents, of whom 32 were patients and 18 were carers. The findings consider in more detail the social relationships between patients, carers and professionals. It is suggested that while there are some encouraging signs of good practice among EOL agencies and professionals, greater care is needed on the part of frontline professionals in their day-to-day interaction with patients and carers to ensure a better quality of EOL care. The oldest old and GP end-of-life care in the Dutch community: a nationwide study; by Ebun Abarshi, Michael A Echteld, Lieve Van den Block (et al).

Provision of adequate care for the oldest old is increasingly crucial, given the current ageing trends. This study explores differences in end-of-life care of the oldest (85+ years) versus the younger (65-84 years) old; testing the hypothesis that age could be an independent correlate of receiving specialised palliative care services (SPCS), having palliative-centred treatment and dying in a preferred place. General practitioners (GPs) participating in the nation-wide representative network in the Netherlands were asked to fill in patient, illness and care characteristics of all registered patients 765 years, who died non-suddenly in their practices between 2005 and 2008, using standardised forms. Associations with the palliative care variables were tested using multiple logistic regression. Results: nine hundred and ninety patients were registered. Among the oldest old, there were more women than men, more patients with heart failure than cancer, less hospital and home deaths and more residential care home deaths compared with the younger old. Of the oldest old, fewer received SPCS and more preferred to die in a residential care home than the younger old. Age was independently associated with palliative care provided: compared with the younger group, the oldest old received SPCS less often (OR = 0.7) and were treated with a palliative-centred goal more often (OR = 2.4); but age was not related to dying in a preferred place, i.e. independent of other characteristics. This study shows age to be independent associated with receiving SPCS in the Dutch community. Although the GPs do recognise the 'palliative phase' in the oldest old, involvement of specialist teams is somewhat less. (KJ)

Palliative care beyond cancer; by Tony Delamothe, Mike Knapton, Eve Richardson (et al).

A series of six brief reviews especially commissioned for the inaugural BMJ Spotlight series. It focuses on palliative care for non-cancer conditions and the role that it should play in modern medical care of the hospital patient or care home resident. It highlights the work being undertaken by the Dying Matters coalition; the current document published this year, of the UK's General Medical Council, "Treatment and Care towards the End of Life"; and initiatives that will raise the awareness of death and dying well in our modern society. A protocol for determining differences in consistency and depth of palliative care service provision across community sites; by Nadine Schuurman, Valerie A Crooks, Ofer Amram.

Health and Social Care in the Community, vol 18, no 5, September 2010, pp 537-548.

Numerous accounts document the difficulty in obtaining accurate data regarding the extent and composition of palliative care services. Compounding the problem is the lack of standardisation regarding categorisation and reporting across jurisdictions. In this study, the authors gathered both quantitative and spatial (or geographical) data to develop a composite picture that captures the extent, composition and depth of palliative care in the Canadian province of British Columbia (BC). The province is intensely urban in the southwest, and is rural or remote in most of the remainder. They conducted a detailed telephone survey of all palliative care home care teams and facilities hosting designated beds in BC. They used geographic information systems to geocode locations of all hospice and hospital facilities. In-home care data was obtained individually from each of five BC regional health authorities. In addition, they purchased accurate road travel time data to determine service areas around palliative facilities and to determine populations outside a 1-hour travel time to a facility. With this data, they were able to calculate three critical metrics: (i) the population served within 1 hour of palliative care facilities - and more critically those not served; (ii) a matrix that determines access to in-home palliative care measured by both diversity of professionals as well as population served per palliative team member; and (iii) a ranking of palliative care services across the province based on physical accessibility as well as the extent of in-home care. In combination, these metrics provide the basis for identifying areas of vulnerability with respect to
not meeting potential palliative care need. In addition, the ranking provides a basis for rural/urban comparisons. Finally, the protocol introduced can be used in other areas and provides a means of comparing palliative care service provision amongst multiple jurisdictions. (KJ/RH) ISSN: 09660410

The Lien Foundation, a philanthropic organisation in Singapore commissioned the Economist Intelligence Unit (EIU) to devise a “Quality of Death” Index to rank 40 countries according to their provision of end-of-life care. This report outlines the index methodology, overall rankings, and what constitutes a high or low quality of death. The report examines the cultural issues (e.g. attitudes to death and dying) and the economics (i.e. funding models) of end-of-life care. It covers policy issues in end-of-life care: the extent to which governments recognise the importance of palliative care; integration of care into mainstream services; and building capacity for home-based care. While the report finds that the UK leads the world in quality of death, the UK performs less well on indicators such as the basic end-of-life healthcare environment, cost of care and availability of pain killers (morphine and morphine equivalents). The author also conducted interviews with more than 20 experts worldwide - including palliative care specialists, physicians, healthcare economists and sociologists - to review existing research. A detailed examination of the Index findings and country scores is also available (see website www.qualityofdeath.org). (RH)

The End of Life Care Strategy for England (2008) identified workforce development as one of the essential factors to the future success of the Strategy’s implementation. The Strategy recognised the importance of the role of the specialist palliative care workforce. The National Council for Palliative Care (PCPC) carried out this survey in partnership with the NHS Information Centre and the NHS Workforce Review Team; the results of previous surveys carried out in 2005 and 2007 are on NCPC’s website (www.ncpc.org.uk). The survey is the only comprehensive survey of the specialist palliative care workforce makeup, including both NHS and voluntary sector. This briefing gives and overview of the national results and identifies some priorities for the future; of particular concern are vacancy rates and the rising proportion of nurses who are aged over 50 (33.6% in 2008). The results of previous surveys carried out in 2005 and 2007, also reports from Strategic Health Authorities (SHAs) and cancer network levels are available free on NCPC’s website (www.ncpc.org.uk). (RH)
Supporting persons with Down syndrome and advanced dementia: challenges and care concerns; by Mary McCarron, Philip McCallion, Elizabeth Fahey-McCarthy (et al).

The aim of this study was to understand staff perceptions of critical issues in caring for persons with intellectual disability (ID) and advanced dementia. There has been growing interest in addressing resource, training, and service redesign issues including an increase in collaborative practices in response to the growing incidence of dementia among persons with ID. Most recently, this has included consideration of the specific issues in advanced dementia. Thirteen focus group interviews were held involving staff in six ID services and one specialist palliative care provider in Ireland. A qualitative descriptive approach was taken to analysis. Staff identified three key themes: (1) readiness to respond to end of life needs, (2) the fear of swallowing difficulties, and (3) environmental concerns and ageing in place. Four underlying issues that emerged in this study offer clues to solutions: (a) differences in staff preparation associated with settings; (b) lack of understanding and lack of collaboration with palliative care services; (c) uncertainties about the ability to transfer existing palliative care models to persons with ID and dementia; and (d) the need to develop training on end stage dementia and related care approaches. This study explored terminally ill older people’s anticipation of future support, which may be particularly important due to their vulnerable state and resulting support needs. Qualitative data was gathered from face-to-face interviews with 100 older Americans receiving hospice care, 85 of whom discussed anticipating future support. Content analysis revealed that anticipating support was based on current experiences of received support, and that the definition of future extended beyond death for some who anticipated surviving loved ones receiving grief support. Not all anticipation of support evoked positive feelings. Some respondents anticipated receiving unhelpful support or felt guilty about anticipating support from overburdened caregivers. Implications are discussed regarding the role of social workers in working with caregivers to ensure that the terminally ill older people they care for can anticipate future support in their dying process and after death. This document is published as an immediate response to the new Government’s early identification of personalisation and empowering people amongst its defining priorities. It was written in August 2010 and takes account of policy announcements made up to and including that date, in particular the Coalition’s ‘Programme for Government’ and the White Paper ‘Equity and excellence: liberating the NHS’. The National Council for Palliative Care (NCPC) intends to explore how end of life care can help build compassionate communities and support as part of the “Big Society”. The document explains what the NCPC and the Dying Matters coalition will be doing to ensure that palliative and end of life care continues to be a key priority for decision-makers at every level. Variations in place of death in England: inequalities or appropriate consequences of age, gender and cause of death?; by Kate Ruth, Andrew Pring, Julia Verne, National End of Life Care Intelligence Network - NEoLCIN, NHS End of Life Programme, Department of Health - DH; South West Public Health Observatory - SWPHO. London: NHS End of Life Programme, Department of Health - DH, August 2010, 88 pp.

This report, the first in a series commissioned by the National End-of-Life Care Intelligence Network (NEoLCIN) and written by the South West Public Health Observatory, follows on from the launch of the Network’s website (www.endoflifecare-intelligence.org.uk). It highlights variations in where people die and
challenges current thinking about the appropriateness of different end of life care settings for different groups, depending on their age, sex and socioeconomic status. The report summarises the key features from the first tranche of national End of Life Care Profiles to provide the first comprehensive overview for England of variations in place of death by geography, demography and main cause of death. The report also includes some additional data not included in the profiles, for example analyses by deprivation quintile. Among key findings in an Executive Summary are that in 2007, there were 471,092 deaths in England, of which 52% (246,412) were females compared with 48% (224,680) males. This equates to about 1,300 deaths per day in England and about one death per minute. In comparison, there were 672,809 live births in 2008 in England which equates to about 1,843 births per day and about 1.3 births per minute. (KJ/RH)
A national action plan, 'Living and dying well' (Scottish Government, 2008), sets out a plan for delivery of high quality palliative and end of life care for everyone who needs it across all care settings in Scotland. This report aims to raise awareness of the need for such care in all care homes. Inspections showed that 587 (57%) of the care homes in the sample understood the importance of this; and this report includes examples of good practice. However, a sizeable minority of care homes fell short on aspects of best practice in respect of recognising need and in providing training around sensitive issues surrounding death and dying. The report also includes what was learned from complaints about palliative and end of life care, and makes recommendations about such provision. (RH)

Caring for individuals with end-stage dementia at the end of life: a specific focus on hospice social workers; by Sara Sanders, Peggy Swails.
With more individuals reaching the end stages of dementia, it is crucial to determine how professionals view their work with end-stage dementia patients and their caregivers. During this ethnographic study, the beliefs and practices about dementia care of 13 American hospice social workers were documented for 19 months through interviews, in-field observations, and chart reviews. It was determined that although hospice social workers use a wealth of practice skills with individuals with end-stage dementia and their caregivers and strive to enhance patients' personhood, they also possess a neutral to negative view of practice with this population and see their role as limited and ambiguous compared to how they view their work with cognitively intact patients. This study has implications for how hospice social workers and other healthcare professionals provide end-of-life care for patients and families who are dealing with dementia and the types of training that should be implemented in hospice agencies to strengthen end-stage dementia care. (RH)
Common core competences and principles for health and social care workers working with adults at the end of life to support the National End of Life Care Strategy; by National End of Life Care Programme, NHS, Department of Health - DH; Skills for Health; Skills for Care.: Electronic format. June 2009. 31 pp. Skills for Health and Skills for Care have been working with the End of Life Care Programme (EoLCP) and the Department of Health (DH) to develop workforce competences and core principles as they relate to end of life care. This document aims to support workforce development, training and education, and in identifying learning and development needs of staff in palliative and terminal care. The main competences are: communication skills; assessment and care planning; symptom management, maintaining comfort and well-being; advance care planning; and overarching values and knowledge. Seven principles underpin all workforce and service development, activity and delivery, irrespective of level and organisation, and concern: choices and priorities of the individual; effective, straightforward, sensitive and open communication; delivery through close multidisciplinary or interagency working; individuals, families and friends being well-informed; care being delivered in a sensitive, person-centred way; care and support to anyone affected by a person's end of life and death; and workers supported to develop knowledge, skills and attitudes. Appendices include case examples linking competences and principles to workforce development in health and social care, and a list of useful resources and internet links from specialist organisations. A cross cultural review of the ethical issues in dementia care in Kerala, India and The Netherlands; by C V Sowmini, Raymond De Vries.
The diverse ethical issues in the care of people with dementia in the Netherlands and Kerala, India are explored, using cross-cultural data and a review of the literature. The medical paradigm is dominant in the Netherlands, and awareness of dementia as an organic brain disease is low in Kerala. Institutionalised care is more common in the Netherlands and home-based care is the norm in Kerala. Institutional care is costly, whereas home-based care is stressful for caregivers. The advanced directive plays an influential role in the Netherlands, but this mechanism is yet to evolve in Kerala. The legal and social setting of the Netherlands has a strong influence on physician decision-making concerning end-of-life issues. In Kerala, decisions on these matters is nearly unknown. Limited awareness of dementia in Kerala should be addressed in public forums, which can then be used to garner government support. The predominantly institutional model of care-giving in the Netherlands and home-based caregiving in Kerala each have their strengths; policy makers in both societies can usefully apply the value merits inherent in both models. A culturally appropriate implementation of the advanced directive will have beneficial medical, social and economic impacts in Kerala. The remarkable disparity between these two examples in dealing with end-of-life issues will allow more philosophically and socially informed ways of dealing with the ethical questions that arise in these situations. According to the author, "death has become a behind the scenes activity". In this book, she highlights the changing trends in both cause and place of death, and illustrates the diversity of cultural and religious responses. She explores what is meant by palliative care, and how it is currently being implemented both in Scotland and elsewhere. She outlines the development of hospice care from its traditional building-based model, to the extending of the hospice philosophy into care homes and into people's own homes. Also examined is the interpretation of spiritual care, and our understanding of the stages of grief and of the experience of mourning. A focus of this book is the identification of the key skills that can enhance practice: the need for good communication both with the individual and family members, and with the range of professionals involved; and the quality of multi-professional and multi-disciplinary contact. Particularly important is what can be termed "disenfranchised grief", that is, grief that may not be acknowledged or sanctioned. Issues for policy and practice, for example, assisted suicide, euthanasia, and end-of-life care are discussed. (RH)

In November 2006, "Dementia: supporting people with dementia and their carers in health and social care", a joint National Institute for Health and Clinical Excellence (NICE) and Social Care Institute for Excellence (SCIE) guideline to improve the care of people with dementia was released. This influential policy document reflects both a medicalised approach to care (emphasizing pharmacological management and health services) as well as one characterized by professional dominance (an emphasis on professional authority and control). Despite the involvement of social sciences in its development, the policy reflects common biases in other areas of policy and practice in the care of older people. Furthermore, the idea that people with dementia have complex end of life care needs is addressed only with the most cursory and clinically oriented approaches to palliative care. A critical commentary about this policy approach is supplemented with a brief description of an alternative policy vision that connects older people's care with a wider public health approach to end of life care for older people. Palliative care social work has developed primarily as a specialist health-related form of clinical social work. However, the resource-intensive modernist medicalized practice of Western countries has been culturally inappropriate elsewhere. Broader end-of-life care and community education outside healthcare settings offers opportunities to develop palliative care social work in the direction of social development practice. (KJ/RH)

The 'End of life care strategy' published in July 2008 included a quote from Dame Cicely Saunders (founder of the modern hospice movement), "How people die remains in the memory of those who live on". This article looks at the work of the St Joseph's Hospice in Hackney which embraces that ethos. It focuses on the different beliefs of black and minority ethnic (BME) communities in dealing with illness and death. The role of the organisation Social Action for Health (SAFH) as a broker between the hospice and BME communities, in helping with varying needs and expectations as the death of a relative approaches, is outlined. When terminally ill patients become mentally incapacitated, their surrogates often make treatment decisions in collaboration with health care providers. The authors examined how surrogates' errors in reporting their spouses' preferences are affected by their gender, status as durable power of attorney for health care (DPAHC), whether they and their spouses discussed end-of-life preferences, and their spouses' health status. Structural equation models were applied to data from married couples in their mid 60s from the 2004 wave of the Wisconsin Longitudinal Study. Surrogates reported their spouses' preferences incorrectly 13% and 26% of the time in end-of-life scenarios involving cognitive impairment and physical pain, respectively. Surrogates projected their own preferences onto their spouses' preferences. Similar patterns emerged regardless of surrogate gender and status as DPAHC, marital discussions about end-of-life preferences, or spousal health status. Implications for the process of surrogate decision making and for future research are discussed. (KJ/RH)

Despite the assumption that the home is the preferred place of death, most people will die in institutional care, specifically in acute hospital wards. Inevitably, this relatively public setting puts the privacy and dignity of the dying patient and grieving visitors at considerable risk. This study used observation of practice and staff interviews to describe the process of recognizing, communicating and managing dying on an acute medical
A gerontology ward in a large teaching hospital in the United Kingdom. The particularly public nature of hospitals in the United Kingdom is critically examined in the light of privacy as a fundamental component of maintaining dignity and the "good death". (KJ/RH)

Dying old in the 21st century: a neglected issue for social work; by Margaret Holloway.
Dying in old age has become the majority dying of the developed world, yet older people are routinely denied palliative care, their dying characterized by failure to facilitate choice and recognize their needs. Social workers in all settings should embrace their contribution to quality end-of-life care for older people. (KJ/RH)

End of life care in dementia; by Elizabeth L Sampson, Louise Robinson (eds).
This issue considers the current and future needs of those with dementia at the end of their life. This will be a challenge in health care, given that by 2021 one million people in the UK will experience dementia, with similar increases throughout the world. One in three of the UK population over the age of 60 years will die whilst having a dementia and the quality of end-of-life care may be less than optimal. The UK Government has attempted to address these issues through the End of Life Care Strategy (NHS, End of Life Care Programme, 2007) and the National Dementia Strategy (Department of Health, 2009). This issue is an acknowledgement of how health and social care professionals and researchers are working to provide equitable access and improved services for people with dementia and their families and caregivers. There is a need to develop new and cost-effective ways to improve the quality of care that is provided. Examples of some initiatives at a local level are beginning to demonstrate how effective multidisciplinary bridges can be built, and these are presented. Through innovative practice and coordinated use of existing resources, not 'high-tech solutions', large improvements in the quality of care can be made. (KJ/RH)

The End of Life Care Strategy published in July 2008 was the first such strategy for the UK. Using practice examples from different localities, this first annual progress report takes stock of how challenges in meeting end of life care are being met. It reviews issues including: death, dying and bereavement; the end of life care pathway; care in different settings; support for carers and families; development of the care workforce; and research projects. End of life care strategy: quality markers consultation: [summary of] consultation response; by Philip Hurst, Charlotte Potter, Age Concern England - ACE; Help the Aged. London: Age Concern England; Help the Aged, February 2009, 2 pp (Consultation response Ref: 0709(S)).
The Department of Health (DH) is consulting on markers of quality for end of life care. Among recommendations made by Age Concern England (ACE) and Help the Aged are that there should be quality markers that relate specifically to psychological, social spiritual and practical support; and that acute care and other settings should take into account the concepts of dignity and compassion at the end of life. (RH)

End of life treatment: decisions and attitudes of doctors; by National Council for Palliative Care - NCPC. London: National Council for Palliative Care, June 2009, 8 pp (Briefing 17).
This briefing reports on the initial findings from a postal survey of 8857 UK doctors across a range of specialisms carried out by Professor Clive Seale of the Centre for Health Sciences at Queen Mary University of London in 2007 and 2008. Respondents were asked about the decisions they made about the provision, withdrawing or withholding treatment at the end of life, and their attitudes towards physician-assisted suicide and euthanasia. Of the 3733 who replied, 2869 had attended one or more people who had died in the previous year (representing more than 70000 deaths). About 40% of the reported deaths involved end of life treatment decisions that were judged to have the potential to shorten life (involving either a "double effect" or a non-

A consultation from the General Medical Council (GMC) has offered draft guidance for doctors in end of life treatment and care, which updates the existing guidance, ‘Withholding and withdrawing life-prolonging treatments’ (2002). Age Concern and Help the Aged respond in detail to the full written consultation, particularly in the context of current developments in end of life care and the need for a more joined-up approach to how older people and their families are treated in hospital. The focus on decision-making processes following the Mental Health Act is welcomed, but the consultation appears to overlook the importance of empathy.

Japan's mortality rate has increased dramatically, and end-of-life care for older people is bound to become an issue of serious concern in Japan. While older people often spend the last moments of their lives at hospitals, most generally prefer to remain at home during the last part of life. However, there has been little variation in the number of hospital beds available and the wish to die at home may for some patients be unrealistic; as a result, a growing number are expected to die at long-term care facilities. In order to provide adequate palliative care, long-term care facilities must typically operate with the following setbacks: lack of 24-hour medical personnel, limited availability of medical treatment, high prevalence of dementia, wide variety of resident prognosis, and heavy reliance on facility staff to provide care. The purpose of this review is to summarize the studies that clarify current end-of-life care policies and practices at long-term care facilities in Japan, aiming at defining the necessary conditions for optimal end-of-life care provision at long-term care facilities for elders. Briefly examined are staff education, cooperation with acute care hospitals, as well as end-of-life related discussions with residents and families to propose ways to enhance end-of-life care for long-term care facility residents. What is the relation between the care provided in the final three months of life and the prevalence of and types of end of life care in Belgium? End of life decisions including euthanasia or physician assisted suicide are not related to a lower use of palliative care in Belgium but instead often occur within the context of multidisciplinary care. This summary article outlines the findings of a 2-year nationwide mortality retrospective study in 2005, which collected observational data via the Sentinel Network of General Practitioners, an epidemiological surveillance system representative of all Belgian general practitioners (GPs). This is a summary of a paper that was published on bmj.com as BMJ 2009: 339:b2772. (RH)

Participants were 17 general practitioners (GPs) and 19 nurses (16 district nurses and 3 clinical nurse specialists) from 15 general practices in three areas of central England with differing socio-geography and participating in the the Gold Standards Framework for palliative care. Practices were selected on the basis of size and level of adoption of the framework. All interviewees bar one had experience of discussing preferred place of death with terminally ill patients. They reported that preferences for place of death frequently changed over time and were often ill defined or poorly formed in patients’ minds. Preferences were often described as being co-created in discussion with the patient or, conversely, inferred to the health professional without direct questioning or
receiving a definitive answer from the patient. The inherent uncertainty challenged the practicability, usefulness, and value of recording a definitive preference. The extent to which the assessment of enabling such preferences can be used as a proxy for the effectiveness of palliative care delivery is also limited by this uncertainty. Generally, interviewees did not find discussing preferred place of death an easy area of practice, unless the patient broached the subject or fed the discussions. Further research is needed to enable development of appropriate training and support for primary care professionals. Better understanding of the importance of place of death to patients and their carers is also needed. (RH)

Frailty and type of death among older adults in China: prospective cohort study; by Matthew E Dupre, Danan Gu, David F Warner (et al).
Participants were 13,717 older Chinese people aged 65+ from the 2002 and 2003 waves of the Chinese longitudinal healthy longevity survey carried out in 22 provinces throughout China. Multinomial analyses showed that higher levels of frailty significantly increased the relative risk ratios of mortality for all types of death. Of those with the highest levels of frailty, men were most likely to experience 30 or more bedridden days with suffering before death, and women 30 or more bedridden days with no suffering. Regardless of frailty, centenarians and nonagenarians were most likely to experience fewer than 30 bedridden days with no suffering, whereas those aged 65-79 and 80-89 were more likely to experience fewer than 30 bedridden days with suffering. Adjusting for compositional differences had little impact on the links between frailty and type of death for both sexes and age groups. The association between frailty and type of death differs by sex and age. Health scholars and clinical practitioners should consider age and sex differences in frailty to develop more effective measures to reduce preventable suffering before death. (RH)

Gender differences among Canadian spousal caregivers at the end of life; by Kevin Brazil, Lehana Thabane, Gary Foster (et al).
Health and Social Care in the Community, vol 17, no 2, March 2009, pp 159-166.
The primary research question for this study was to determine gender differences in caregiver strain among spousal caregivers. Secondary research questions investigated included: the presence of gender differences among spousal caregivers in the duration of care provided; gender differences among spousal caregivers in formal service use and unmet service needs; and whether support to care recipients in activities of daily living (ADLs) varied according to the gender of the spousal caregiver. The study was conducted over a 2-year period (2000-2002) in south-central Ontario, Canada. The study sample included 283 informal spousal caregivers (198 females, 85 males) each of whom were caring for a terminally ill spouse at the time they participated in a cross-sectional telephone survey. The analysis showed that females reported a significantly greater level of caregiving strain than males. When considering source of support in activities of daily living for the care recipient, differential assistance was noted on the basis of caregiver gender. Female caregivers had almost twice the odds of providing support in toileting-related tasks than male caregivers, while male caregivers had approximately twice the odds of providing support in mobility-related tasks. Care recipients who had a female caregiver had lower odds of receiving support from family and friends in tasks associated with personal care. To address gender differences in caregiving, a realistic home-based palliative care approach must take into account the importance of informal caregivers. (KJ/RH)

The Mental Capacity Act 2005 (MCA) became law in 2007, and governs the way in which decisions are made by and on behalf of adults who have impaired mental conditions to make decisions for themselves. This summary guidance is intended to help patients and informal carers as well as health and social care staff in all settings, including care homes, hospices, hospitals and primary care. It aims to introduce people to the MCA, and to explain its importance for end of life decision making. It also explains how the Act can be used to identify and respect people's choices about their future care, and to improve the quality of end of life care decision-making. 'The Mental Capacity Act in practice: guidance for end of life care' (NCPC, March 2008) gives more detailed guidance on the impact of the MCA on end of life and palliative care. Reference to that
document is strongly recommended, as well as to items in the list of other publications and online information resources. Funding was received from the Department of Health to publish this guidance. (RH)

Help us to promote living and dying well; by National Council for Palliative Care - NCPC; Department of Health - DH.: National Council for Palliative Care, 2009, 6 pp.
The End of life care strategy announced the formation of a new national coalition to support implementation of the strategy. The National Council for Palliative Care (NCPC) is to lead this Public Awareness Coalition, which aims to promote awareness and support changing attitudes and behaviours towards death, dying and bereavement, and to make a "good death" the norm. This pamphlet outlines the purpose and structure of the coalition; lists possible indicators of success; and presents responses to NCPC's first public awareness survey in January 2009. It also invites interested organisations to sign up: an inaugural Forum will be held in May or June 2009. (RH)

How to improve end of life care in acute hospitals; by Merryn Gott, Jane Seymour, Michael Bennett (et al).
A greater emphasis on palliative care can help counter failures that lead to the poor care of older people who end their lives in hospital. This article highlights the need to improve care for older people dying in acute hospitals. It discusses the role that nurses have to play in promoting better care and in making the necessary changes easier. A 3-year project funded by the National Institute for Health Research under the Service Delivery and Organisation (SDO) programme aims to contribute to the evidence base for generalist palliative care management in acute hospitals in England. The reader is directed to a website (www.transitionstopalliativecare.co.uk) for more information about the project. (RH)

The impact of late-life parental death on adult sibling relationships: do parents' advance directives help or hurt?; by Dmitry Khodyakov, Deborah Carr.
The authors examined whether the effect of parental death on adult siblings' relationship quality varies on the basis of the presence and perceived effectiveness of a deceased parent's formal preparations for end-of-life care. The authors used data from the Wisconsin Longitudinal Study, and focused on the relationship quality of a bereaved adult child and his or her randomly selected sibling. Parental death was associated with a decrease in sibling closeness. The parent's use of advance directives (living will and durable power of attorney for health care) did not have uniformly positive effects on siblings' relationship quality. Sibling relationships suffered when the living will was believed to "cause problems"; but relationships improved when the deceased parent named someone other than his or her spouse of a child as durable power of attorney for health care. The authors discuss the implications for developing effective end-of-life preparations that benefit both the decedent and surviving kin. (RH)

ISSN: 01640275

Living and dying with dignity: a qualitative study of the views of older people in nursing homes; by Sue Hall, Susan Longhurst, Irene Higginson.
Most older people living in nursing homes die there. An empirically based model of dignity has been developed, which forms the basis of a brief psychotherapy to help promote dignity and reduce distress at the end of life.
The objective of this study was to explore the generalisability of the dignity model to older people in nursing homes. Qualitative interviews were used to explore views on maintaining dignity of 18 residents of nursing homes. A qualitative descriptive approach was used. The analysis was both deductive (arising from the dignity model) and inductive (arising from participants’ views). The main categories of the dignity model were broadly supported: illness-related concerns, social aspects of the illness experience and dignity conserving repertoire. However, sub-themes relating to death were not supported and two new themes emerged. Some residents saw their symptoms and loss of function as due to old age rather than illness. Although residents did not appear to experience distress due to thoughts of impending death, they were distressed by the multiple losses they had experienced. These findings add to our understanding of the concerns of older people in care homes on maintaining dignity and suggest that dignity therapy may bolster their sense of dignity. (KJ/RH)

In 1995, the NCPC in collaboration with the Department of Health (DH) developed a minimum data set (MDS) for palliative care. This bulletin updates the review work undertaken so far, which has lead to a revision of the questionnaires used to produce the MDS (which can be found on the NCOC website). The bulletin includes the findings from the 2007-8 National Data Collection and gives comparisons with previous years. The findings relate to data received from inpatient units, day care units, home care services, hospital support services, and out-patient services in response to a questionnaire (78% overall response rate). A fuller report is available from the NCPC, and available for subscribers to download in the Online Library (at www.ncpc.org.uk). (RH)

Out of the shadows: end of life care for people with dementia; by Lucy Sutton, Emily Sam, Karen Harrison Dening (et al), National Council for Palliative Care - NCPC; for dementia. London: National Council for Palliative Care - NCPC, 2009, 43 pp.
The National Council for Palliative Care (NCPC) was given funding by Lloyds TSB Foundation for the 2-year Palliative Care and Dementia project, and this publication is the culmination of that work. It brings together current understanding of the issues and challenges, and is informed by the needs of people with dementia and their carers, not only for advance care planning and the assessment and management of symptoms, but also with regard to distress, hydration, nutrition, spiritual needs, and caring for carers. The key findings are mapped against the nationally recommended pathway from the End of life care strategy in England (EoLCS). The importance of partnership working is highlighted by the inclusion of local practice examples and case studies, with contributions from general practitioners (GPs) and specialist researchers, as well as from the Dementia Working Group (DWG). There remains a lack of understanding of dementia and the end of life, and NCPC recommends that national policies must join up end of life care and dementia to ensure that local service development does not leave people with dementia caught between two strands of care. (The National Dementia Strategy was about to be published). (RH)

Price: £20.00 (free to subscribers)

The National End of Life Care Strategy for England was published in 2008, and similar initiatives are being produced by Scotland, Wales and Northern Ireland. This Best Practice Guide suggests improved education, improved communication with the palliative care team, and an integrated care pathway as most important in such a strategy. It defines palliative, terminal and specialist palliative care. It lists those issues in end of life care of older people on which research studies have identified inadequacies. It considers elements that are important to a good death, noting the appendix which lists the 12 principles of a good death as identified by Age Concern, as well as legal and ethical aspects of end of life care, also the role of the geriatrician. (RH)

The prison population in the United States has grown fivefold in the last 27 years. Like the general population, the inmate population is ageing. With age comes infirmity, disability, and chronic conditions that may, over the
course of years or decades, lead to death. Inmates enter the prison system in poorer health than their age-matched free counterparts. A growing number of inmates will die in prison. A few will receive medical or compassionate release in order to die "outside the walls." Whether inside or outside, these dying men and women are entitled to receive high quality health care, including palliative care. Dying inmates face many of the same issues as the terminally ill in free society. However, death behind bars also poses some unique challenges to the dying, their prison family, their biological family, their caregivers and health care providers, custody staff, prison administration, and society as a whole. Social workers can play an important role in the care of these individuals and the people they are connected to both in prison and beyond its confines. This article provides important background for understanding the unique and the ubiquitous aspects of dying inmates. It offers direction to social work professionals in serving these inmates, their loved ones, their custodians, and the larger society. (KJ/RH)

A population-based retrospective cohort study comparing care for Western Australians with and without Alzheimer's disease in the last year of life; by Lorna Rosenwax, Beverley McNamara, Renate Zilkens.
Health and Social Care in the Community, vol 17, no 1, February 2009, pp 36-44.
Health service use for people in the last year of life was investigated, comparing those who died with and without Alzheimer's disease (AD) documented on the death certificate. Using a population-based retrospective cohort design and utilising the Western Australian Data Linkage System for the period 2000-2002 (2.5 years), the study found 992 people died of AD alone or AD with at least one other condition recorded on the death certificate. Of those with documented AD, 90.4% were aged 75+, and a majority lived in a major city (77%). Most deceased people had comorbidities recorded on death certificates (90%), the majority having either two (34.5%) or three (28.5%) comorbid conditions. Over two-thirds of those aged 75+ with AD died in residential aged care facilities (RAFC, 67.4%), while the greatest proportion of those without AD died in hospital (52.9%). When a comparison was made in the use of hospital and community-based services for decedents aged over 75 with and without AD, dissimilarities were evident. Less than half of those with documented AD received hospital care in the last year of life (46.3) compared to more than 80% without AD (80.5%). Likewise, fewer people in the Alzheimer's group received community care when compared to those without documented AD (10.8% vs 28.5%). Despite a small group of people with AD (5.4%) who were transferred to an RAFC shortly before dying, most people in this group lived and died in an RAFC and had their care provided in this setting. Adequate nursing, medical and allied health services, and the provision of appropriate social support, including the use of advance care directives in RAFCs, are essential for equitable provision of care to people with AD. (RH)

This discussion document strongly endorses a partnership between dementia care and palliative care services as a means of improving the care of people with dementia at the end of life. It considers: the progressive nature of dementia and its impact on cognition; the challenges of advanced dementia such as advance care planning and identifying the time of transition towards more palliation; and helping people with dementia and their families. It describes four examples of partnerships between palliative care and dementia. The aim is to stimulate further discussion amongst all health and social care staff involved with the person with dementia and carers, and to highlight gaps in knowledge and the need for education in both palliative and dementia care services, such that as many questions are asked as are answered. Prognosis is important in decision-making in Dutch nursing home patients with dementia and pneumonia; by Jenny T van der Steen, Margaret R Helton, Miel W Ribbe.
A survey study explored how physicians treating nursing home residents with dementia and pneumonia in the Netherlands consider prognosis in their treatment decision. Data were collected between July 2006 and March 2008 from 69 physicians from 54 nursing homes in the Netherlands, who completed a questionnaire on symptoms, treatment, and prognosis for their next dementia patient newly diagnosed with pneumonia. They were also asked a general question regarding withholding antibiotic treatment and prognosis. Outcome was assessed at least two months afterwards. Two-week mortality risk if treated with antibiotics was calculated with a validated prognostic score. The patients not treated with antibiotics had high (92%) actual 2-week mortality, while only 12% of patients treated with antibiotics died. Physicians believed that mortality risk was high in the untreated group and would have been only slightly lower if treated with antibiotics (mean estimated risk 73%), which was higher than predicted from the risk score (42%). In general, three-quarters of physicians considered withholding antibiotics appropriate for mortality risks between 75% and 90%. Prognosis is an important consideration when Dutch nursing home physicians make antibiotic treatment decisions for patients with dementia and pneumonia. This suggests they prefer not to treat with antibiotics when to do so is probably futile. Physicians in other countries may hold different views on futility, which should be addressed in larger, cross-national comparative studies (KJ/RH)

Recognition and management of pain in patients with dementia; by Jolyne O'Hare, Clare White, Peter Passmore (et al).
GM (Geriatric Medicine), vol 39, no 4, April 2009, pp 227-232.
The risk of developing dementia rises exponentially with age and about a third of people will die with dementia. Palliative care is appropriate for many patients. Cognitive function may alter patients' perception of pain, and communication difficulties can lead to under-recognition and undertreatment. In such patients, use of observational scales for assessing pain is recommended. Appropriate pain control can help to improve the holistic management of patients with dementia. (KJ/RH)

This study identified characteristics among social work students that influence their level of comfort with end-of-life practice situations. Two hundred and seventy-two students from the United States and Canada completed an online survey that assessed levels of death anxiety, experience with death, and comfort with end-of-life care. The majority of respondents were MSW students. Multiple regression analysis demonstrated that students with less death anxiety, those who had already completed or were interested in hospice field placements, had personal experience with death, and were age 35+ had greater comfort levels. Results of this research have implications for social work education and practice by contributing knowledge that may be useful in the development of end-of-life curricula and continuing education programmes. The authors of a European Parliament report on palliative care summarise the process of the five-month investigation, as well as the real and potential results of the study. Engaging a large number of national and international stakeholders, including ministries of health, national palliative care associations and the European Association for Palliative Care (EAPC), the authors were able to draw on a well of previous research and diverse experiences before formulating operative policy options for the European Union (EU) and its Member States. While the report itself fomented some self-examination in the countries studied, its full exploitation by palliative care advocates is still pending. (KJ/RH)
